THE EQUITY EXPRESSION OF THE CHINA BIOTECH THESIS

The Cheque and the Franchise

Chinese drug developers have never sold more science, or been valued less for it. Cross-border out-licensing from Greater China reached a record US$137.7bn in 2025, and US$60bn in the first quarter of 2026 alone — a 73% jump on the same quarter a year earlier. Over the same stretch the Hang Seng Biotech Index has gone backwards. It stood at 15,239.58 on the morning of 10 September, still below the 15,539 level that 13D Research identified as a technical breakout in August 2025.

The question is no longer whether Chinese biotech is good. Head-to-head survival data has settled that. The question is who ends up owning the thing that was proved.

A reframe worth holding onto

13D Research's internal case — carried on the Heyokha Wiki since July 2025 — is that China has crossed from generic manufacturer to global innovation leader, and that the 2027–28 Western patent cliff of roughly US$180bn a year in expiring exclusivity forces multinationals to buy Chinese assets at accelerating prices. The reframe: stop treating licensing deals as one-off windfalls and read them as the market-clearing price of a pipeline that now out-produces the United States. This is 13D's view, not a forecast, and the Wiki page carrying it records no contradictions.

Method. Internal material is drawn from the Heyokha research Wiki page *China Biotech* (created 31 July 2025, last reviewed 7 August 2025) and the 13D Research issues feeding it, and is presented as the named provider's opinion. External figures are separately verified against company releases, exchange data and press reporting, and each carries an as-of date. Market data is delayed quote data retrieved 9–10 September 2026. Where the two disagree, both are shown.

Consider a city with one extraordinary architectural practice. Its drawings are better than anyone's — measurably so, in blind competitions against the incumbent firms. Each year it wins more commissions abroad, and each year the fees grow: a cheque on signature, more if the scheme gets planning permission, more still if the building fills with tenants. In the years it signs, the accounts look spectacular. But the developer who bought the drawings owns the freehold. He collects rent for sixty years; the architect collects a percentage, on a building she cannot alter. And two streets away sits the firm that leases drafting tables, prints blueprints and runs the model shop. It bills every practice in the city, every year, whoever wins the competition. That firm has just refinanced at a higher valuation. The architect trades at four times last year's fee income — and last year's fee income will not repeat.

THE STORY IN 60 SECONDS

$137.7bn

Cross-border out-licensing from Greater China in 2025, against $13.9bn in 2021 — close to a tenfold rise in four years. Q1 2026 alone ran at $60bn, up 73% year on year. *Industry deal trackers, reported 2026.*

15,240

Hang Seng Biotech Index, 09:52 HKT on 10 September 2026, down 1.6% on the session — and roughly 2% below the 15,539 breakout level cited internally in August 2025. *Exchange data, 10 Sep 2026.*

27.9 v 23.7

Median overall survival in months, ivonescimab plus chemotherapy against tislelizumab plus chemotherapy, HARMONi-6, hazard ratio 0.66. *ASCO plenary, 31 May 2026.*

WHAT ACTUALLY HAPPENED

A record year the shareholders did not get

The bare facts of the Chinese pipeline are not in dispute, and external reporting has if anything overtaken the internal view. Deal value has compounded from US$13.9bn in 2021 to US$137.7bn in 2025. In the first quarter of 2026, Greater China originators signed US$60bn of cross-border out-licensing, roughly 44% of the entire prior-year total in three months. Average deal size rose about 76% to US$1.3bn, and the average Western upfront climbed roughly 230%, from US$52m in 2022 to around US$172m in early 2026. On 29 January 2026 AstraZeneca agreed terms with CSPC Pharmaceutical worth up to US$18.5bn across eight obesity and diabetes programmes — the largest such arrangement to date.

The clinical evidence has hardened in the same period. At the ASCO plenary session on 31 May 2026, Akeso's ivonescimab — a PD-1×VEGF bispecific, partnered outside China with Summit Therapeutics — showed a median overall survival of 27.9 months against 23.7 for tislelizumab plus chemotherapy in first-line squamous non-small-cell lung cancer, a hazard ratio of 0.66 across more than 500 patients. Overall survival is the endpoint regulators and payers actually pay for, and a harder thing to argue with than the progression-free readouts that first drew attention to the asset. The FDA has accepted Summit's filing in a different indication with an action date of 14 November 2026.

And yet the equities have gone the other way. The ChinaAMC Hang Seng Biotech ETF, the instrument through which the internal view is expressed, closed at HK$15.65 on 9 September, down 14.01% year to date; the internal note reiterating the position on 27 August recorded HK$16.29. Underneath the index the dispersion is wider still. Over twelve months the market capitalisation of WuXi AppTec, which sells research and manufacturing services to everybody, is up 52.3%. That of 3SBio, which signed the then-largest Chinese out-licensing deal in history with Pfizer, is down 51.9% — in a year its reported net income rose 250.7%. That last pairing is the whole edition: a company can book a record profit from selling a molecule and lose half its market value in the same twelve months, because the profit is a disposal and the loss is the franchise.

> THE ESSENTIAL DISTINCTION
>
> Winning the science and owning the franchise are different businesses. China has demonstrably won the first. The second is being sold, deal by deal, to the companies that will book the revenue in 2035. *An upfront payment is what you receive for giving up the second decade of a drug's life.*

MECHANISM

Where the money goes, in four steps

1 · Discovery in China

A candidate is designed, synthesised and taken into the clinic at 30–50% of Western trial cost and roughly twice the pace, inside the only fully integrated pharmaceutical chain — synthesis, contract research, trials, manufacture.

→

2 · Out-licence ex-China

Global rights outside Greater China are sold for cash on signature plus contingent milestones. The originator books a large, non-recurring gain. AstraZeneca's upfront to CSPC was $1.2bn of a $18.5bn headline — 6.5%.

→

3 · Global development

The licensee funds Phase III in Western populations, files with the FDA and EMA, and builds the sales force. It absorbs the regulatory risk — and acquires the relationships with the payers who set the price.

→

4 · The second decade

Revenue accrues to the licensee for the life of the patent. The originator receives a royalty on a franchise it cannot price, cannot reformulate and cannot extend into new indications without permission.

Structure of a representative out-licensing arrangement, drawn from the terms of the AstraZeneca–CSPC agreement announced 29 January 2026 (upfront $1.2bn; up to $3.5bn development and regulatory milestones; up to $13.8bn sales milestones; CSPC retains mainland China, Hong Kong, Macau and Taiwan rights). Individual deals vary materially.

+52.3%

Twelve-month change in the market capitalisation of WuXi AppTec, which sells research and manufacturing capacity to every developer in the chain and owns none of the molecules.

−51.9%

Twelve-month change in the market capitalisation of 3SBio, in a year when reported net income rose 250.7% on the Pfizer upfront. The shares trade on 4.3 times trailing earnings.

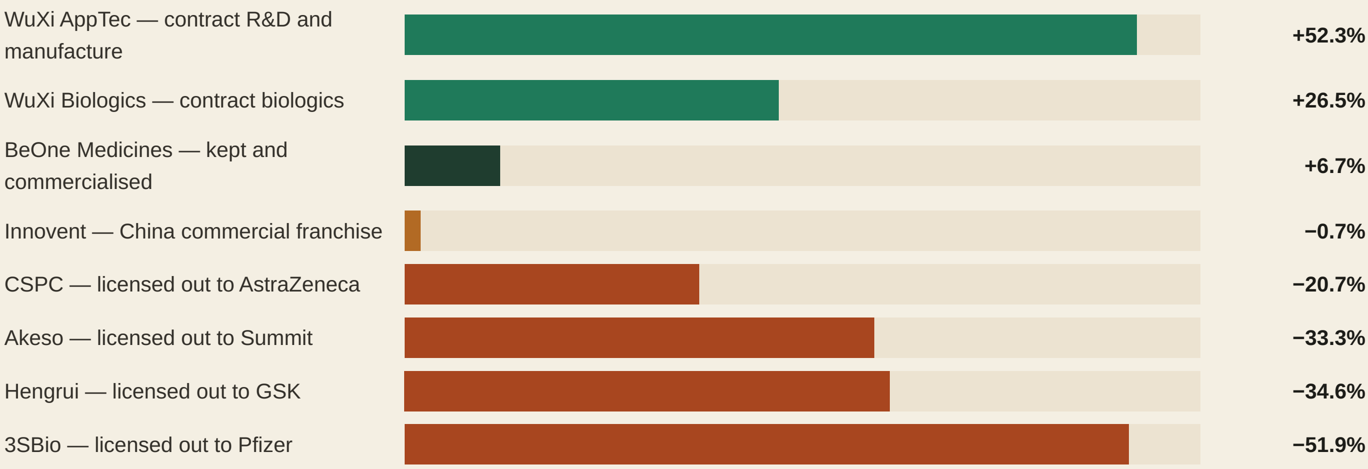
6.5%

Share of the headline AstraZeneca–CSPC deal value paid as cash on signature: $1.2bn of $18.5bn. The remainder is contingent on events the originator does not control.

Market capitalisation changes are twelve-month figures from delayed exchange data retrieved 10 September 2026. Deal terms from the AstraZeneca announcement of 29 January 2026.

THE CENTRAL COMPARISON

The market is paying for position, not for discovery



Twelve-month change in market capitalisation, delayed exchange data retrieved 10 September 2026. Bars are illustrative: length encodes magnitude only, with direction shown in the value column. Ordering is by the company's position in the value chain, not by any ranking of asset quality — Akeso owns arguably the strongest single molecule in the group.

A USEFUL MENTAL MODEL

An out-licensing upfront is a disposal, not a sale of goods. It belongs beside the asset that left, not inside the earnings multiple. A market pricing 3SBio at four times trailing earnings has already made that adjustment. *A headline reporting that net income rose 251% has not.*

WHAT HAS ACTUALLY SHIFTED

Five changes, each cutting both ways

WHAT HAS CHANGED	WHAT IT LOOKS LIKE IN THE DATA	WHY IT CUTS BOTH WAYS
Evidence moved from surrogate to survival	HARMONi-6: median OS 27.9 v 23.7 months, HR 0.66 (95% CI 0.50–0.87), one-sided p=0.0017, ASCO 31 May 2026	Removes the last technical objection to Chinese assets — and simultaneously raises the price Western buyers must pay, which is the originator's only real leverage.

WHAT HAS CHANGED	WHAT IT LOOKS LIKE IN THE DATA	WHY IT CUTS BOTH WAYS
Deal value became structural, not episodic	$13.9bn (2021) to $137.7bn (2025); $60bn in Q1 2026 alone, +73% y/y	Confirms demand is durable. It also confirms that out-licensing, rather than global commercialisation, is now the settled Chinese business model.
Policy shifted from suppliers to transactions	BINSA, introduced 2 June 2026, would add biotechnology to the COINS Act and extend outbound screening to licensing deals and joint ventures	The licensing channel itself becomes reviewable. A screening regime is not a prohibition, though: it prices deals and slows them rather than stopping them.
Tariffs arrived on the finished product	Section 232 framework announced 2 April 2026: 100% on certain imported patented pharmaceuticals; default rate from 31 July 2026 for 17 named large companies, 29 September 2026 for all others	Pushes manufacture onshore, which is unhelpful for Chinese contract volume — and reinforces the argument that the durable value sits with whoever owns the US franchise.
The equity stopped following the science	Hang Seng Biotech Index 15,239.58 on 10 September 2026, below the 15,539 breakout level identified internally in August 2025	Either the market is mispricing a confirmed fundamental improvement, or it is correctly pricing who captures it. Both readings fit the same data.

BULL AND BEAR, STATED FAIRLY

The two cases

The bull case

- **The superiority claim now rests on survival, not surrogates.** HARMONi-6 delivered a 34% reduction in risk of death against an approved PD-1 comparator. That is the endpoint payers price.
- **Demand is arithmetic, not sentiment.** Roughly $180bn a year of Western revenue loses exclusivity in 2027–28 (EY, cited internally). Multinationals must refill pipelines from somewhere, and China is where the molecules are.
- **Scale has crossed over and deal economics are improving.** Chinese firms had 3,575 innovative candidates in development at December 2024, the most of any country; average upfronts are up 230% since 2022 and average deal size up 76%.
- **The toll-takers are compounding today.** WuXi AppTec grew net income 58.8% over twelve months on 21.4 times trailing earnings, without depending on which molecule wins.
- **One company has proved the franchise can be kept.** BeOne Medicines reports HK$48.1bn of revenue, up 34.3%, and HK$5.1bn of net income, having built its own Western commercial organisation rather than licensing out.

The bear case

- **The upfront does not repeat.** 3SBio's net income rose 250.7% and its market capitalisation fell 51.9%. The market is discounting a one-off cash receipt to something close to nothing, and on the evidence it is right to.
- **The franchise leaves with the licence.** CSPC retains only Greater China on eight programmes it discovered. The revenue that matters in 2035 accrues to AstraZeneca, and CSPC cannot influence its price.
- **Policy is now aimed at the transaction.** BINSA would make licensing deals and joint ventures reviewable, not merely equity investment — a direct tax on the one channel through which value flows. A 100% Section 232 tariff line lands on all remaining importers on 29 September.
- **Domestic price is the ceiling that forced the model.** China's seven approved CAR-T therapies sell at roughly a tenth of US prices — one at about $44,000. Reimbursement discipline is why originators license rather than commercialise.
- **Dispersion says the market has already chosen.** Hengrui sits at its 52-week low the year it signed a deal worth up to $12bn with GSK; Akeso is loss-making, down a third, and owns the best molecule in the group.

On the sourcing of the bear case. The internal Wiki page's bear section is thin — three short paragraphs on geopolitical risk, quality scandals and commercial execution, one of which concedes that 13D "does not directly address this risk". The bear case above was therefore built from external reporting on US policy and tariffs, and from the tension inside the companies' own results: rising reported earnings against falling market values.

WHERE INTERNAL AND EXTERNAL PART COMPANY

An unresolved conflict

The internal view and the external record diverge on price, not on facts. Every fundamental claim 13D advanced — clinical superiority, pipeline scale, deal-value acceleration, regulatory throughput — has been confirmed or exceeded by later external reporting. The technical claim has not. In August 2025 the internal note described the Hang Seng Biotech Index as breaking out from 15,539 toward an all-time high of 29,152, implying upside above 70%. Thirteen months on the index is at 15,239.58, marginally below the level from which the breakout was said to have occurred.

This edition does not resolve that. Two readings survive the evidence. The first is that the market is slow, that a 2027–28 patent cliff is not yet in prices, and that the internal view is early rather than wrong. The second is that the market has understood the licensing model perfectly well and prices Chinese originators as contract discoverers — high-quality, low-durability earnings — while paying up for the contract manufacturers and the one company that kept its franchise. The bar chart is consistent with the second reading, the deal data with the first, and nothing available today distinguishes them.

WHAT TO WATCH FROM HERE

The dashboard

SIGNAL	PLAIN-ENGLISH READING	WHY IT MATTERS
29 September 2026	Section 232 default tariff rate extends beyond the 17 named large companies to all remaining pharmaceutical importers	The first date the 100% patented-drug tariff touches the wider industry — a live read on how much China-sourced pipeline is repriced by trade policy rather than science.
14 November 2026	FDA action date for ivonescimab in EGFR-mutated NSCLC after TKI therapy	The first US approval decision on a China-originated PD-1×VEGF bispecific, and the reference price for what a licensed-out Chinese asset is worth.
Upfront as a share of headline value	Currently around 6.5% on AstraZeneca–CSPC; average upfront roughly $172m in early 2026	If the ratio rises, originators are winning negotiating power. If it stays flat, the franchise is still being sold on contingency.
BINSA's path into the FY2027 defence bill	The COINS Act itself became law as part of the FY2026 national defence authorisation	Committee attachment, not floor debate, is how outbound screening becomes law here. The markup calendar is the signal; press coverage is not.
Hang Seng Biotech Index 15,539	The internal view's own stated breakout level, from August 2025; the index sat at 15,239.58 on 10 September 2026	The cleanest falsifiable test of the technical half of the internal case; reclaiming and holding it would settle part of the argument above.

THREE POSTURES, NOT ONE ANSWER

Coherent ways to hold this, and what each costs

Own the toll booth

Contract research and manufacturing organisations bill every developer regardless of whose molecule wins. WuXi AppTec's net income grew 58.8% over twelve months on 21.4 times trailing earnings. **The cost:** these are precisely the companies BIOSECURE-style supplier rules were written to target, and Section 232 onshoring pressure works against their volumes. You take the same political risk as the originators without the optionality on a blockbuster.

Own the franchise-keeper

BeOne Medicines built its own Western commercial organisation instead of licensing out, and is the only large name in the group with rising revenue, positive net income and a higher market capitalisation than a year ago. **The cost:** 60.9 times trailing earnings, and a self-funded global sales force is the most capital-hungry route to monetising a molecule. The premium for keeping the franchise is already visible in the multiple.

Own the discount

3SBio at 4.3 times trailing earnings, CSPC at 12.1 times with a 3.74% dividend yield, Hengrui at its 52-week low — the deal-signers are priced as though the milestones will not arrive. **The cost:** you are underwriting contingent payments you cannot model, in companies whose reported earnings are flattered by non-recurring upfronts, against a policy backdrop that is tightening rather than loosening.

The companies and instruments named throughout this edition are illustrative of the mechanics under discussion. They are NOT recommendations, and nothing here constitutes investment advice.

INSTRUMENTS REFERENCED

2359.HK

WuXi AppTec

HK$190.20
10 Sep 2026

The toll booth. Contract research, development and manufacture across small molecules, billed to originators worldwide. Market capitalisation up 52.3% over twelve months, net income up 58.8%, revenue up 28.3%, on 21.4 times trailing earnings — the best-performing large name in the Chinese pharmaceutical complex, and the one that owns none of the intellectual property.

WATCH NEXT

> Q3 results on 26 October, and any US supplier-eligibility language attached to the FY2027 defence bill.

6160.HK

BeOne Medicines

HK$207.40
10 Sep 2026

The counter-example. Rather than out-licensing zanubrutinib, the company built its own Western commercial organisation, and now reports HK$48.1bn of revenue, up 34.3%, and HK$5.1bn of net income. Market capitalisation up 6.7% over twelve months. It is the only large name in the group demonstrating that the second decade of a drug's life can be retained by its discoverer.

WATCH NEXT

> Results on 6 November, and whether operating leverage holds now that the commercial build is largely funded.

1530.HK

3SBio

HK$15.65
10 Sep 2026

The clearest illustration of the tension. Net income up 250.7% and earnings per share up 238.8% over twelve months, largely on the Pfizer arrangement for SSGJ-707 — and a market capitalisation down 51.9% across the same period. The shares trade on 4.3 times trailing and 14.0 times forward earnings, the gap between those two multiples measuring exactly how non-recurring the market believes the upfront to be.

WATCH NEXT

> Progress of the two SSGJ-707 Phase III programmes Pfizer is running, including the head-to-head against pembrolizumab in first-line lung cancer.

9926.HK

Akeso

HK$95.20
10 Sep 2026

Owns ivonescimab, the asset that produced the survival data described above, and is down 32.05% year to date with a market capitalisation 33.3% lower than a year ago. Revenue grew 37.4% to HK$3.98bn; the company remains loss-making at HK$1.12bn. Global rights outside China sit with Summit Therapeutics. The best molecule in the group belongs to one of its worst-performing shares.

WATCH NEXT

> The 14 November FDA action date on the Summit-run filing, and any read-across to Akeso's own China economics.

1093.HK

HK$8.92
10 Sep 2026

CSPC Pharmaceutical Group

Counterparty to the largest China out-licensing arrangement announced to date: up to $18.5bn from AstraZeneca across eight obesity and diabetes programmes, with $1.2bn paid on signature and Greater China rights retained. Net income up 92.7%, revenue up 20.5%, on 12.1 times trailing earnings and a 3.74% dividend yield. Market capitalisation is nonetheless 20.7% lower than a year ago.

WATCH NEXT

> Whether the AstraZeneca programmes reach the development milestones that convert a headline number into recurring cash.

3069.HK

HK$15.65
9 Sep 2026 close

ChinaAMC Hang Seng Biotech ETF

The instrument through which the internal view is expressed, reiterated on 27 August 2026 at HK$16.29. Down 14.01% year to date with a one-year total return of −13.72%, holding Innovent, BeOne, WuXi Biologics, WuXi AppTec, Akeso, CSPC and 3SBio among its top positions. Because it holds both the toll-takers and the licensors, it nets out precisely the dispersion this edition is about.

WATCH NEXT

> Whether the underlying index reclaims 15,539 — the level the internal view called a breakout in August 2025.

The bottom line

What was repriced over the past twelve months was not Chinese science. That improved, and the external record confirms it in survival data, in approval counts and in a licensing market that ran at US$60bn in a single quarter. What was repriced was the durability of the earnings that science produces for the companies creating it. A market paying 21 times for a contract manufacturer and 4.3 times for the company that signed the sector's largest out-licensing deal is making a statement about ownership, not quality.

The evidence is mixed and this edition does not pretend otherwise: the internal view has been right about every fundamental it asserted, wrong so far about the price, and offers no account of why. The reasonable inference is narrower than either camp would like. China's discovery advantage is real and compounding, and the current contractual structure sends most of its long-dated value abroad. Whether that changes depends less on the next clinical readout than on whether originators can raise the upfront share of deal value, or follow BeOne and keep the franchise. The next test is 14 November — and the answer will be visible less in the approval itself than in whose share price moves on it.

Sources and update notes

Internal. Heyokha research Wiki, page *China Biotech* (theme; active; created 31 July 2025; last reviewed 7 August 2025; 1,626 words), including its Thesis, bull case, bear case, Evidence & data, Evolution and Contradictions sections. Provider issues relied upon: 13D Research WILTW, 31 July 2025 (thesis initiation — clinical superiority, licensing surge, patent cliff); 13D WILTW, 7 August 2025 (M&A validation, regulatory reform, and the Hang Seng Biotech Index breakout call from 15,539 toward 29,152); 13D WILTW, 27 August 2026 (AI as force multiplier; the ETF reiterated at HK$16.29; H1 2026 out-licensing of 81 deals worth $110bn; NMPA 94 novel oncology approvals 2020–25 against the FDA's 87); 13D WILTW, 3 September 2026 (services and IP export boom; seven approved CAR-T therapies at roughly a tenth of US prices). Also consulted in the topic scan: CLSA Bits & Pieces, 4 September 2026.

Limitation on the internal view. The *China Biotech* Wiki page is sourced entirely from 13D Research. Its frontmatter lists two source documents, both 13D WILTW issues from consecutive weeks in 2025, and its two subsequent updates are also 13D. Its Contradictions section states that none have been surfaced, on the grounds that the sources "are both from 13D Research and are mutually reinforcing." It has not been formally reviewed since 7 August 2025, thirteen months before this edition. Single-provider concentration of this kind is a structural weakness: the internal bear case has never been stress-tested by a second house, which is why the bear case here was rebuilt from external material.

External. (1) Hang Seng Biotech Index 15,239.58, −247.13 or 1.60%, previous close 15,486.71, as of 09:52 HKT on 10 September 2026. (2) ChinaAMC Hang Seng Biotech ETF (3069.HK) HK$15.65 at the 9 September 2026 close, YTD −14.01%, one-year total return −13.72%, net assets HK$2.54bn. (3) Cross-border out-licensing from Greater China: US$137.7bn in 2025 against US$13.9bn in 2021; US$60bn in Q1 2026, +73% y/y; average deal value US$1.3bn, +76%; average Western upfront US$52m (2022) to roughly US$172m (early 2026), +230% — industry deal trackers and press reporting, 2026. (4) AstraZeneca–CSPC, announced 29 January 2026: up to US$18.5bn total, US$1.2bn upfront, up to US$3.5bn development and regulatory milestones, up to US$13.8bn sales milestones, eight obesity and type-2 diabetes programmes, CSPC retaining Greater China rights — company announcement. (5) HARMONi-6: median overall survival 27.9 against 23.7 months, HR 0.66 (95% CI 0.50–0.87), one-sided p=0.0017, more than 500 patients, first-line squamous NSCLC — ASCO plenary, 31 May 2026. (6) FDA acceptance of Summit's ivonescimab BLA in EGFR-mutated non-squamous NSCLC after TKI therapy, PDUFA action date 14 November 2026. (7) Section 232 pharmaceutical framework, 2 April 2026: 100% tariff on certain imported patented pharmaceuticals and ingredients, with exemptions tied to onshoring and pricing agreements; default rate from 31 July 2026 for 17 named large companies and 29 September 2026 for all others — law-firm advisories, 2026. (8) Biotech Investment National Security Act (BINSA), introduced 2 June 2026 by Representatives Moolenaar and Dingell, would add biotechnology to the COINS Act and extend outbound screening to licensing deals and joint ventures — Congressional and law-firm sources. (9) Company data, delayed exchange quotes retrieved 9–10 September 2026, market-capitalisation changes twelve-month: WuXi AppTec (2359.HK) HK$190.20, +52.3%, net income +58.8%, revenue +28.3%, PE 21.4; WuXi Biologics (2269.HK) HK$48.00, +26.5%, revenue +17.8%, PE 35.7; BeOne (6160.HK) HK$207.40, +6.7%, revenue HK$48.06bn +34.3%, net income HK$5.14bn, PE 60.9; Innovent (1801.HK) HK$95.55, −0.7%, revenue +37.5%; CSPC (1093.HK) HK$8.92, −20.7%, net income +92.7%, PE 12.1, yield 3.74%; Akeso (9926.HK) HK$95.20, YTD −32.05%, −33.3%, revenue HK$3.98bn +37.4%, net loss HK$1.12bn; Hengrui (1276.HK) HK$44.68 at its 52-week low, −34.6%; 3SBio (1530.HK) HK$15.65, −51.9%, net income +250.7%, PE 4.31, forward PE 14.03; Summit (SMMT) US$17.54 at the 9 September close, −27.5%. (10) Pfizer–3SBio licensing of SSGJ-707 completed 24 July 2025 for US$1.25bn plus a US$100m equity investment; two Phase III programmes running as of August 2026, including a head-to-head against pembrolizumab in first-line NSCLC.

Editorial choices in this automated run. The archive folder was read directly rather than through the remote-device bridge and all thirty-nine prior editions parsed successfully, so the thirty-day cooldown check is complete — no inference was required. Entity scoring across the twenty-one days of sources to 10 September ranked gold miners (16), oil and gas (10), silver (10), critical minerals (9) and food security (9) above China Biotech (8). Each of the five was passed over because an adjacent edition had covered the same ground inside the cooldown window: Gold on 26 August and Silver Miners on 3 September; Oil Chokepoint Risk on 12 August and Iran War on 27 August; Rare Earth Magnets on 25 August; and Grain Supply Shock on 31 August. China Biotech was the highest-scoring theme with no adjacent recent edition, has never been the subject of one, and carried a clear hot signal — "China's AI-biotech rise" headlines the 27 August 13D WILTW, is reiterated on 3 September, and the theme appears in the CLSA high-conviction list of 4 September. Tooling: the Wiki MCP server responded normally, though the theme listing exceeded the token limit and was extracted from disk. No external source failed; yfinance and direct HTTP fetching remained blocked, so all market data came through search and browser retrieval of delayed quotes, and every price here should be treated as delayed.
