

Daily Need to Know

Tuesday, 8 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — FRIDAY 4 SEPTEMBER SETTLE, 98 HOURS OLD. MONDAY 7 SEPTEMBER WAS LABOR DAY; THERE WAS NO US CASH SESSION.			
S&P 500	7,718.60	▼ 29.11 / 0.38%	Opened at 7,750.19 — the exact high of the day — and closed at 28% of its 7,706.12–7,750.19 range. Equal-weight S&P fell 0.51%, so the cap-weighted index outperformed its own median constituent by 13bp.
Nasdaq Composite	26,506.99	▼ 77.07 / 0.29%	Closed at 34% of range. Held up by memory and by AMD/Intel, not by its largest weights: Apple –2.51%, Microsoft –2.04%.
Dow Jones	53,414.25	▼ 271.86 / 0.51%	Worst of the majors. Closed at 36% of range.
Russell 2000	2,975.648	▲ 7.377 / 0.25%	The only major index up, and it closed at 96% of its daily range. Implied prior close 2,968.271 (vendor prior-close field was corrupt; change and close are internally consistent).
Philadelphia SOX	11,735.262	◆ not verified	Level is Friday's settle. The vendor returned a flat bar with zero open/high/low, so the daily change could not be verified this morning — SOXX +3.52% and SMH +2.61% are the working proxies. SOX sits 19.9% below its 22 June high of 14,655.29.
EQUITY INDEX FUTURES — MONDAY'S ABBREVIATED LABOR DAY SESSION; LAST PRINT AT THE 18:00 ET GLOBEX REOPEN, I.E. 06:00 HKT, ROUGHLY TEN MINUTES BEFORE CAPTURE			
S&P 500 fut (Sep) @SP.1	7,710.25	▼ 11.75 / 0.15%	Range 7,703.50–7,728.50 on 137,587 lots — a real if thin holiday session, not noise. Friday's settle of 7,722.00 sat 3.40 <i>above</i> cash; the future now sits 8.35 <i>below</i> Friday's cash close.
Nasdaq 100 fut (Sep) @ND.1	29,609.00	▲ 43.75 / 0.15%	The only equity future up on Monday. 88,638 lots. Sits 64.85 above Friday's cash NDX of 29,544.155.
Dow fut (Sep) @DJ.1	53,117.00	▼ 323.00 / 0.60%	A 0.60% fall on a holiday session is a genuine move, not drift. Dow futures and Nasdaq futures moved in opposite directions by 75bp overnight.
Russell 2000 fut	—	◆ unavailable	No Russell future resolved from the fallback vendor this run. IWM's Friday close of 296.01 (+0.28%) is the only small-cap mark available.
RATES — FRIDAY 5:05PM ET SETTLE. US CASH TREASURIES WERE SHUT ON MONDAY; THE FUTURES WERE NOT.			
US 10-year	4.784%	▲ 2.2bp	Traded as high as 4.812% on Friday. December 10-year future fell 0.0938 on Monday, so the pressure continued while cash was shut. Sits at 73.3% of Hedgeye's 4.63–4.84 band.
US 30-year	5.244%	▼ 0.2bp	30s10s +46.0bp. December bond future –0.1875 on Monday.
US 5-year	4.548%	▼ 0.2bp	The belly did nothing on Friday while the long end and the front end pulled apart.
US 2-year	4.374%	◆ –0.5bp on settle	Conflict. The settle series shows the 2-year 0.5bp <i>lower</i> on Friday; wire coverage reported it touching its highest since January 2025 intraday. The vendor bar carried no open/high/low, so the intraday high is unverified here. Both can be true.
13-week bill	3.857%	▲ 0.2bp	10s3m +92.7bp. The bill is anchored by a 3.50–3.75% funds target the market now thinks may rise.
ENERGY & METALS — LIVE, CAPTURED 06:07-06:10 HKT. THESE TRADED THROUGH MONDAY'S US HOLIDAY.			
WTI crude (CL1)	92.61	▲ 1.13 / 1.24%	Range 90.87–93.29. 79.6% of Hedgeye's 84.74–94.63 band. Up on Iranian attacks on tankers in the Strait of Hormuz over the weekend.
Brent (BZ1)	97.27	▲ 0.99 / 1.03%	Touched 98.05 intraday before easing. WTI-Brent spread 4.66.
Natural gas (NG1)	2.966	▼ 0.009 / 0.30%	Range 2.921–2.998. 63.5% of the 2.82–3.05 band. The one energy contract that did not follow crude up.
RBOB gasoline	3.2246	▲ 0.01 / 0.31%	Pump prices set a record Labor Day high on the back of the oil rally and Hormuz disruption.
Gold — spot	4,411.72	▲ 7.05 / 0.16%	29.3% of the 4296–4691 band — low in the range. Note the December future fell 0.40% while spot rose; the two series disagreed on direction. Futures-spot basis 47.08, or 1.07% .

Silver — spot	66.3056	▲ 0.1656 / 0.25%	55.1% of the 63–69 band, the only band Hedgeye marks neutral. Basis to futures 0.55 (0.83%). Vendor returned no high/low for spot.
Copper	6.706	▲ 0.0235 / 0.35%	Measured on futures, not spot — see the footnote. On futures this is 98.7% of the 6.40–6.71 band, i.e. effectively at the ceiling.
DOLLAR, VOLATILITY & CRYPTO			
Dollar index (DXY)	98.902	▼ 0.274 / 0.28%	LIVE. A full Monday session, range 98.832–99.209. The September dollar future independently gave –0.26%, so the move is corroborated. 33.8% of the 98.51–99.67 band.
USD/JPY	154.33	◆ noise	LIVE but only ~70 minutes old. The spot bar rolled at 17:00 ET; its range is 154.31–154.38, four pips. Treat the level as real and the change as meaningless.
USD/KRW	1,345.00	◆ noise	Same caveat — range 1,344.75–1,345.39 since the roll. Level matters this morning because Korea has the most to reprice; the change does not.
VIX	15.30	▲ 0.77 / 5.30%	Friday close, and it closed at 94% of its own daily range (14.99–15.32) on a day the S&P closed at 28% of its. 60.1% of Hedgeye's 13.75–16.33 band. September VIX future 16.30, a 1.00 premium to spot.
Bitcoin	79,185.97	▼ 634.63 / 0.80%	LIVE. Range 78,683.90–80,526.00 — the only instrument in this table that traded continuously through the whole weekend. CME September future 79,330, a 144-point premium. Ether 2,489.81, –0.04%.

▲ up · ▼ down · ◆ flat, unverified or not meaningful. Reconciliation: cash index arithmetic was checked and is self-consistent for every index shown (S&P 7,747.71–29.11=7,718.60; Nasdaq 26,584.06–77.07=26,506.99; Dow 53,686.11–271.86=53,414.25). Copper is measured on the front NYMEX contract because the spot series Hedgeye actually names was not reachable this morning; at 98.7% of band the sign of any basis matters, so treat that one reading as indicative. Full detail in section 18.

TL;DR

Over a weekend when the US was shut, Iran attacked tankers in the Strait of Hormuz, Brent touched **\$98.05**, and the four-day week now opens with fed funds futures pricing roughly a **57% chance the Fed raises rates on 16 September** — with August CPI landing Friday. Friday's tape was a distribution pattern: the S&P opened at the exact high of its day and closed in the bottom third, the VIX closed at 94% of its range, and only three of eleven sectors finished green — yet the Russell 2000 was the only major index up and closed at 96% of its range, which is the opposite of what the newly-raised Quad 2 call implies. The single largest dislocation is in semiconductors: DRAM contract prices are forecast up more than 50% this quarter; memory ripped on Friday (Micron +6.10%), and Korea gapped **+4.61%** on Monday — all of it against Hedgeye's stated positioning, which is zero semis, short DRAM, short South Korea.

2 The big picture — what it means

The market is now pricing a rate rise, not a rate cut, and that is the frame for everything else. August payrolls came in at **162,000 against a 55,000 consensus** — a beat of roughly three times — with unemployment unchanged at 4.1%. Fed funds futures moved to price about a **57% probability of a 25bp hike** at the 15–16 September FOMC, which would take the target from 3.50–3.75% to 3.75–4.00%. That is why equities fell on a strong jobs number: good news is hawkish news when the policy debate is about hiking rather than easing.

Friday was a distribution session dressed as a small down day. The headline loss was 0.38%. The internals were worse than that. The S&P opened at 7,750.19, which was also its high for the day, and closed at 7,718.60 — 28% of the way up its range. The equal-weighted index fell **0.51%** against the cap-weighted 0.38%, so the median S&P constituent underperformed the index. Three of eleven sectors closed green. The VIX rose 5.30% and closed at 94% of its own range. Opening on the high and closing near the low, with breadth worse than the tape, is what supply looks like.

The Russell contradicted the thesis on the very day it was published. Hedgeye's Early Look on Friday raised the probability of back-to-back monthly Quad 2s, and a core Quad 2 factor call is that **large caps beat small caps**. On Friday the Russell 2000 rose 0.25% and closed at 96% of its daily range while the S&P fell 0.38% and closed at 28% of its. One session is not a refutation of a monthly regime call, but it is the inconvenient number and it belongs on the page.

Energy is the transmission mechanism that makes the hike real. Iran said it targeted three oil tankers using an unauthorised route through the Strait of Hormuz, plus several US-linked vessels, in retaliation for American attacks on Iranian tankers. Brent rose 1.03% to 97.27, touching **98.05**; WTI rose 1.24% to 92.61 and now sits at **79.6%** of its Hedgeye band. The July CPI print of 3.4% was described as easing precisely *because* the earlier energy shock was fading. That fade has now stopped. Friday's CPI is the test.

The biggest single dislocation in the market is inside semiconductors, and it is running against consensus positioning. Susquehanna and TechInsights published forecasts that DRAM contract prices rise more than 50% this quarter, with NAND up around 60%. Micron closed +6.10% at 1,016.59, AMD +4.69%, Intel +4.51%, SOXX +3.52% — on a day the S&P fell. Software went the other way: IGV –2.23%, Microsoft –2.04%.

That is a **5.75 percentage-point spread against long-software / short-semis in a single session**, which is the trade Hedgeye describes as its biggest.

Mega-cap leadership has narrowed to almost nothing. Five of the Magnificent Seven fell on Friday. Apple -2.51% and Microsoft -2.04% were among the worst, and Tesla fell **5.92%**. Technology (XLK) still closed +0.70% — entirely on the strength of memory and Intel, despite its two largest holdings each falling more than 2%. A sector index rising while its heaviest weights fall is a rotation signal, not a strength signal.

Monday's futures split tells you the rotation carried through the holiday. Nasdaq 100 futures rose 0.15% on Monday while Dow futures fell **0.60%** and S&P futures fell 0.15% — a 75bp gap between the Nasdaq and the Dow across a thin holiday session. Meanwhile Asia was sharply higher: Kospi **+4.61%**, Nikkei +2.12%, Taiwan +1.67%. Asia has already repriced Friday's memory news; the US futures have not.

3 Rates, currencies & commodities

- **The curve steepened at both ends and did nothing in the middle.** 10s2s +41.0bp, 30s10s +46.0bp, 10s3m +92.7bp. The 10-year settled at 4.784% after touching 4.812%; the 5-year was unchanged at 4.548%. December 10-year and 30-year futures both fell on Monday, so the direction persisted while cash was shut.
- **The 2-year is the one number this brief cannot settle.** The settle series has it at 4.374%, half a basis point lower on Friday. Wire coverage said it hit its highest since January 2025. The vendor bar carried no intraday data, so the level is reported as a settle and the intraday claim is left attributed rather than asserted.
- **The dollar fell on Monday and that is a real move, unlike the spot crosses.** DXY -0.28% to 98.902 across a full session with a 98.832-99.209 range, independently corroborated by the September dollar future at -0.26%. The individual spot pairs — euro, yen, won, Taiwan dollar, offshore yuan — all rolled their session at 17:00 ET and carry bars roughly seventy minutes old. Their levels are usable; their change figures are not.
- **A falling dollar into a hawkish repricing is the odd couple of this brief.** Hedgeye is short the dollar and marks it bearish TREND, with the index at 33.8% of its band. If the Fed does hike on 16 September the dollar short is the position most directly in the firing line, and it is one of the few Hedgeye positions currently working.
- **Crude is doing the work that makes Friday's CPI dangerous.** WTI at 92.61 is at 79.6% of its band and Brent printed 98.05. Keith McCullough said on Friday that oil returning to three-month highs was what pushed the CPI Nowcast to 3.55%. The weekend's Hormuz attacks came after that remark, so the Nowcast as published already understates the weekend.
- **Gold is low in its band and its two series disagree.** Spot rose 0.16% to 4,411.72 — only 29.3% of the 4296-4691 band — while the December future fell 0.40%. The basis is 1.07%, wide enough that measuring the band on the wrong series would move the read by roughly ten points of band position. Spot is the series Hedgeye names, and spot is what is used here.
- **Copper is pinned at the ceiling.** On the front NYMEX contract, 6.706 against a 6.40-6.71 band is 98.7% — effectively through it. The spot series Hedgeye actually publishes against was not reachable this morning, so this is the one band position in section 4 that carries a genuine measurement caveat rather than a rounding one.

4 Hedgeye — regime, risk ranges & the Quad path

Macro dashboard

MEASURE	READING	NOTE
US Monthly Quad	QUAD 1 — growth up, inflation down	As printed in the Macro Week Summary Notes of 4 September. This is the stale half of the picture — see the Quad path below.
US Quarterly Quad	QUAD 4 — growth down, inflation down	Defensive and volatility assets. Unchanged from the prior edition.
Global Quad	QUAD 3 — growth down, inflation up	Stagflation protection.
VIX gauge	14.53	The value carried in the 4 September notes. The VIX has since settled at 15.30, above the gauge reading.
Inflation Nowcast	3.55% CPI	Up 5-6bp over the week to 4 September, attributed by McCullough to oil returning to three-month highs. Pre-dates the weekend's Hormuz attacks.

The Quad path — flagged: this changed, and it has not yet flowed into the dashboard

Friday's Early Look led with the words "**BREAKING: Hedgeye's Inflation Nowcast Ticks Higher For Both SEP and OCT - Upping Monthly Quad2 Probability.**" The stated consequence is **back-to-back monthly Quad 2s in September and October**, replacing a prior sequence of Quad 1 in September then Quad 2 in October, with December and January already modelled Quad 2 — described on the Macro Show as **four Quad 2 months in five**. The dashboard above still prints US Monthly as Quad 1: the shift is forecast, not yet booked. **No explicit forward-path notation was seen this run.** The path lives on page 2 of the US Monthly Quad Forecast inside the Macro

Week Summary Notes PDF, which the browser could not page through on the prior run and which has not been republished since. Absence of a printed path is not evidence the path is unchanged.

Risk Range™ Signals — Early Look, Friday 4 September, 19:40 GMT+8

INSTRUMENT	IMMEDIATE-TERM RANGE	TREND	WHERE IT STANDS NOW
10-Year UST Yield	4.63 – 4.84	bullish	4.784% — 73.3% of band , and it touched 4.812% on Friday, within 3bp of the ceiling. The tightest-pressed band in the table.
High Yield (HYG)	79.00 – 79.55	bullish	79.16 — 29.1%. Low in a very narrow 0.55-wide band.
Inv. Grade (LQD)	104.9 – 106.3	bearish	105.48 — 41.4%. Hedgeye is short this.
S&P 500 (SPX)	7632 – 7781	bullish	7,718.60 — 58.1%. Mid-band; 62.60 of downside to the floor, 62.40 of upside to the ceiling. Almost perfectly balanced.
Nasdaq Comp (COMPQ)	26001 – 26798	bullish	26,506.99 — 63.5%.
Russell 2000 (RUT)	2917 – 3013	bullish	2,975.648 — 61.1%. Higher in its band than the S&P is in its, which is awkward for the large-over-small Quad 2 call.
Health Care (XLV)	169 – 177	bullish	171.45 — 30.6%. Fell 1.04% on Friday, one of the worst sectors, on a long position.
Tech Software (IGV)	102 – 113	bullish	104.57 — 23.4% , the second-lowest position in the table. Fell 2.23% on Friday. This is the long leg of the biggest trade.
Oil Services (OIH)	411 – 440	bullish	427.53 — 57.0%. Fell 0.53% on Friday despite crude rising.
Volatility (VIX)	13.75 – 16.33	bearish	15.30 — 60.1%, and rising. 1.03 of headroom to the ceiling.
US Dollar (USD)	98.51 – 99.67	bearish	98.902 — 33.8%. Working.
WTI Crude (WTIC)	84.74 – 94.63	bullish	92.61 — 79.6% and pressing after the weekend.
Natural Gas (NATGAS)	2.82 – 3.05	bullish	2.966 — 63.5%.
Gold — spot (GOLD)	4296 – 4691	bullish	4,411.72 — 29.3% . Measured on spot, as published. On the December future it would read materially higher; the 1.07% basis is exactly the error the series discipline exists to prevent.
Copper — spot (COPPER)	6.40 – 6.71	bullish	6.706 on the front future — 98.7%, at or through the ceiling . Spot was unreachable this morning; this is the one caveated reading.
Silver — spot (SILVER)	63 – 69	neutral	66.3056 — 55.1%. The only band marked neutral.

Band moves versus the prior session: zero, and known to be zero rather than assumed. Hedgeye published no Early Look on Monday 7 September because US markets were shut for Labor Day, and none at the weekend. The 4 September set is therefore live for a third consecutive edition and is byte-identical to the set carried in the 7 September brief — this is a verified carry-forward, not a stale-band fallback. It is superseded by Tuesday's Early Look at roughly 19:40 GMT+8 today, after this brief is delivered.

What Keith actually said

From the Early Look, "#Quad2 Then #Quad2?", published 4 September 07:40 ET / **19:40 GMT+8**:

- "BREAKING: Hedgeye's Inflation Nowcast Ticks Higher For Both SEP and OCT - Upping Monthly Quad2 Probability." — Keith McCullough, Early Look
- "Bond Yields continues to TREND higher (irrespective of what government guys try to do short-term)" — Keith McCullough, Early Look
- "Did you know that High Beta Momentum (Long Semis vs. Short Software) has crashed -77% from its June #MOAB highs? Did you know that Long AI Software vs. Short Semis (SMH) was +5.1% yesterday to +17.9% in the last month?" — Keith McCullough, Early Look
- "LARGE Cap performance starts beating SMALL Cap (in #Quad1 it's the other way around)" — Keith McCullough, Early Look

The Macro Show summary notes of 4 September (11:48 ET / **23:48 GMT+8**) carry an explicit publisher warning that they have been enhanced by AI and may contain errors. They are therefore reported here as attributed summary, outside quotation marks, and not as verbatim quotation:

- Payrolls at 162,000 against 55,000 expected were characterised as hawkish, with the market said to be looking through the jobs report toward CPI, which McCullough expects bond managers to front-run.
- The portfolio is described as short rate-sensitive exposure, with **TLT as the biggest short**, alongside utilities and zero-coupon Treasuries.
- The dollar was said to have moved from the top of its range to the low end in a single day, prompting what was described as one of the more aggressive one-day gold sales in any asset class in the past year.

- Hedgeye is described as holding **zero semiconductor exposure**, having been long DRAM and semis in May and June and exited, and as effectively net short semis versus long software.
- Turkey (TUR) and NOBL were both sold in full on stop-loss discipline. China and South Korea both remain bearish trade and trend, with Korea named as near the top of the list for incremental shorts.
- Tier1 Alpha was cited as estimating roughly **\$14bn** of expected flow buying, and positive gamma was explicitly described as not equivalent to a bullish market — dealers sell strength and buy weakness.

Positioning changes seen in the feed

The ETF Pro Plus weekly, published Monday 7 September 13:00 ET / 01:00 GMT+8 on Friday's closing prices, shows **27 bullish and 13 bearish** positions. Additions dated 1–4 September: bullish Gold Miners (GDX), South Africa (EZA), Bitcoin (IBIT), Natural Gas (UNG), Managed Futures (DBMF), Wheat (WEAT); bearish AMD Option Income (AMDY), Global Airlines (JETS) and — all three added on 4 September — **Technology Momentum (PTF), Industrials Momentum (PRN) and Quality Momentum (JOET)**. Three momentum-factor shorts added in a single day is the clearest positioning statement in the feed. There is still no semiconductor long anywhere on the bullish list. Signal Strength Stocks moved to 62 names on 4 September, adding PBR, AR, WFC and RRC and removing TRU, AMZN, EFX, EXPGY, MCO, PM, ETSY and CXXIF.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Nvidia (NVDA)	230.36	▲ 0.84%	\$5.552T	Largest company in the table and one of only two Mag7 names up. Range 229.63–234.76; closed nearer the low.
Apple (AAPL)	319.97	▼ 2.51%	\$4.670T	Worst of the mega-caps bar Tesla. Range 317.86–328.93, closed at 21% of it.
Alphabet (GOOGL)	338.46	▼ 1.11%	\$4.067T	Described on Friday's Macro Show as having bounced without going bullish TREND.
Microsoft (MSFT)	499.70	▼ 2.04%	\$3.711T	Closed below 500 and at 3% of its 499.36–511.00 range — effectively on the low. The largest software weight, on the day software broke down.
Amazon (AMZN)	258.51	▼ 0.15%	\$2.788T	Flat, and removed from Hedgeye's Signal Strength Stocks list on 4 September.
Meta (META)	616.77	▲ 1.00%	\$1.571T	The other Mag7 gainer. Described as having flipped to bullish TREND "barely", and attributed to flows rather than news.
Tesla (TSLA)	354.08	▼ 5.92%	\$1.398T	Worst large-cap in the market. Cybercab launch disappointed and NHTSA opened an audit into how Tesla self-certified a vehicle with no steering wheel, pedals or mirrors.

Five of seven fell. Combined capitalisation \$23.757tn. Caps are vendor fundamental fields on Friday's closes and are internally consistent with price × implied share count for every name; they move with the price and should be read as of Friday, not this morning.

6 Positioning & options

- **The VIX closed at 94% of its daily range on a day the S&P closed at 28% of its.** That divergence — protection bid into the close while the index leaked — is the single cleanest positioning tell in Friday's data. VIX 15.30, up 5.30%.
- **The September VIX future sits at 16.30, a 1.00 point premium to spot.** A contango of that size going into a CPI print and an FOMC in the same fortnight is modest; the curve is not pricing an event premium of any size.
- **Tier1 Alpha was cited as estimating roughly \$14bn of flow buying** hitting on 3 September. McCullough's stated read was that positive gamma means dealers sell strength and buy weakness, not that the market is bullish — and that with limited upside to the top of the range there were, in his framing, many reasons to sell and get paid.
- **Real-Time Alerts was described as having had more shorts than longs for the first time in a while**, which McCullough noted was itself unusual. He also said he expected not to finish that day net short and could finish net long, so the signal is a lean rather than a stance.
- **Three momentum-factor shorts were added on a single day.** Technology Momentum, Industrials Momentum and Quality Momentum all entered the bearish list on 4 September. Taken with a stated zero weighting in semiconductors, the book is positioned for the momentum complex to keep unwinding.
- **The Bitcoin position is mid-range.** IBIT was added bullish on 2 September at 45.23 against a 43.00–47.29 TREND range — 52.0% of band. Bitcoin spot has since fallen 0.80% over the weekend to 79,186.

7 Sector rotation — leaders & laggards

SECTOR SPDR	CLOSE	FRIDAY	NOTE
Technology (XLK)	187.28	▲ 0.70%	Green only because of memory and Intel. Its two largest holdings, Apple and Microsoft, fell 2.51% and 2.04%.

Industrials (XLI)	175.27	▲ 0.41%	Second-best. Yet Industrials Momentum (PRN) was added to Hedgeye's short list the same day.
Utilities (XLU)	43.08	▲ 0.12%	Third and last green sector — on a day yields rose, which is not what the Quad 2 script says utilities should do. Hedgeye is short XLU.
Materials (XLB)	52.44	▼ 0.34%	Down despite copper firming.
Real Estate (XLRE)	43.93	▼ 0.72%	Rate-sensitive, and it behaved like it.
Financials (XLF)	58.10	▼ 0.79%	A steeper curve did not help the banks.
Staples (XLP)	84.58	▼ 0.80%	No defensive bid — staples fell alongside cyclicals.
Energy (XLE)	64.06	▼ 0.87%	Fell 0.87% on a day crude rose 1.24%. The most contradictory line in the table.
Health Care (XLV)	171.45	▼ 1.04%	A Hedgeye long, and among the worst performers.
Communications (XLC)	112.03	▼ 1.19%	Dragged by Netflix −5.35% and Alphabet −1.11%.
Consumer Disc. (XLY)	114.91	▼ 1.33%	Worst sector , on Tesla −5.92%.

- **Leaders:** Technology, Industrials, Utilities — three of eleven. That is the narrowest possible definition of leadership, and Technology's is borrowed from semiconductors rather than earned by its largest weights.
- **Laggards:** Consumer Discretionary, Communications and Health Care, all down more than 1%. Two of those three moves are single-stock: Tesla and Netflix.
- **The rotation that matters is not sector-level at all — it is semis versus software.** SOXX +3.52% against IGV −2.23% is a 5.75 point spread in one session, dwarfing the 2.03 point spread between the best and worst sectors.
- **Energy down on rising crude, utilities up on rising yields.** Both sectors did the opposite of what their driver implied. On a low-volume pre-holiday Friday that is more likely positioning than information, but it is worth watching whether it persists this week.

8 Forward — futures & the week ahead

The overnight tape is thin and split. Across Monday's abbreviated Labor Day session, S&P futures fell 0.15% on 137,587 lots and Dow futures fell 0.60% on just 10,982 lots, while Nasdaq 100 futures rose 0.15% on 88,638 lots. The Dow future's volume is low enough that its 0.60% fall should be treated as directional colour rather than a firm mark. Crude, metals and crypto traded through and gave the cleaner signal: oil up on Hormuz, gold spot up marginally, dollar down 0.28%. Cash Treasuries were shut but December note and bond futures both fell, so yields pressed higher without a cash market to print them. The week is compressed to four sessions, which concentrates everything into Friday's CPI.

DAY (GMT+8)	KEY EVENTS
Tue 8 Sep (today)	Oracle Q1 earnings, after the US close — the first read on enterprise software spending since the rate repricing, and Oracle is unusually rate-exposed given its stated \$43bn of bonds sold with further debt and equity planned. NFIB Small Business Optimism 18:00. US 3-year note auction 01:00 Wed. Hedgeye's Tuesday Early Look publishes ~19:40 and supersedes every risk range in section 4.
Wed 9 Sep	MBA mortgage applications; ICSC weekly retail sales. US 10-year note auction — the first real test of demand at 4.78% with a possible hike eight days later.
Thu 10 Sep	PPI — the last inflation input before CPI. Existing home sales, EIA crude inventories. US 30-year bond auction. Adobe earnings.
Fri 11 Sep	August CPI, 20:30 GMT+8 / 08:30 ET. The single event of the week. July printed 3.4% year-on-year; Hedgeye's Nowcast is 3.55% and was struck before the weekend's oil move.
Tue 15 – Wed 16 Sep	FOMC. Decision Wednesday 16 September. Market-implied odds of a 25bp hike to 3.75–4.00% were roughly 56–58% as of Friday.

*Calendar entries are drawn from published weekly event calendars and, for CPI and FOMC, from the releasing bodies' own schedules. Oracle and Adobe earnings dates are from secondary calendars and are **unconfirmed against the exchange calendar** this run.*

9 Corporate news

- **Tesla −5.92% to 354.08.** The Cybercab launch event failed to impress and the NHTSA opened an audit into how Tesla self-certified the vehicle without a steering wheel, pedals or mirrors — equipment it is claiming exemption from. A regulatory audit of a self-certification is a slower and more structural problem than a disappointing launch.
- **Micron +6.10% to 1,016.59**, its highest close in the data captured. Susquehanna and TechInsights forecast DRAM contract prices rising more than 50% this quarter, with NAND up around 60%, driven by AI server deployment. Micron traded 32.5m shares.

- **Intel +4.51% to 95.80 on 86.6m shares** — the heaviest volume of any name captured this morning. AMD +4.69% to 477.57.
- **Netflix –5.35% to 78.25.** Attributed to rate repricing hitting the longest-duration earnings hardest, alongside a mixed reception to newly announced European subscription price increases and profit-taking after a run. Netflix is reported to be trading 14% lower across 2026.
- **Palantir –4.49% to 174.33,** extending a decline after a strong prior rally. Notable given how heavily the name features in the high-beta momentum complex that Hedgeye says has crashed 77% from its June highs.
- **Oracle +3.08% to 158.78 into today's earnings.** It had risen 5.7% on Thursday on dovish Fed commentary; its sensitivity to rate expectations cuts both ways, and it reports into a market pricing a hike.
- **Apple –2.51% and Microsoft –2.04%,** both closing near their lows. Microsoft closed below 500 at 3% of its daily range.

10 Macro data

- **August non-farm payrolls: 162,000 actual against 55,000 consensus.** A beat of 107,000, or roughly three times expectations, and well above the previous month's weak print. This is the number that turned the September FOMC into a live hike debate.
- **Unemployment rate: 4.1%, unchanged and in line.** The labour market got stronger without the participation or wage detail being the story — the level of hiring alone did the work.
- **August CPI is due Friday 11 September, 08:30 ET / 20:30 GMT+8. July printed 3.4% year-on-year,** a second consecutive monthly slowdown from 3.5%, with the monthly rate at 0.1%. Shelter eased to 3.2% from 3.3%; food was unchanged at 3.0%. **No published consensus for the August print was obtained this run** — that is a gap, and it matters, because the miss is the story.
- **Hedgeye's own CPI Nowcast stands at 3.55%,** up 5–6bp over the week to 4 September. If that is right the August print reverses two months of disinflation. It was struck before the weekend's Hormuz attacks and the move in Brent to 98.
- **The disinflation of the past two months was explicitly attributed to the fading of an earlier energy shock.** That attribution is the reason this week's oil move is a macro event and not a commodity story.
- **Current fed funds target 3.50–3.75%; a 25bp hike would take it to 3.75–4.00%.** Market-implied probability of that hike was reported between 56% and 58% on Friday. Two sources gave different figures; both are Friday-dated and neither was re-verified this morning.

11 Geopolitics

- **▲ Iran and the United States traded attacks over the weekend.** Iran said it targeted three oil tankers using what it called an unauthorised route through the Strait of Hormuz, along with several US-linked vessels, describing the action as retaliation for American attacks on Iranian tankers. These are claims made by the parties involved and are reported as such; independent confirmation of the strikes was not obtained this run.
- **▲ Brent touched 98.05 and eased.** The market response was contained — roughly 1% on both crude benchmarks — which suggests traders are pricing harassment of shipping rather than closure of the strait. That pricing is the thing to watch, not the headlines.
- **◆ US pump prices set a record Labor Day high** on the combination of the oil rally and Hormuz disruption. This is where a geopolitical event becomes a domestic political and inflation event, and it lands eleven days before an FOMC that may hike.
- **▲ Chinese crude buying was cited as returning,** adding a demand-side support to the supply-side risk premium. Two independent bids under the oil price at once is a different setup from a pure risk premium that fades.
- **◆ European equities were unmoved.** Stoxx 600 closed flat at 649.90, CAC 40 +0.33%, DAX –0.15%, FTSE 100 –0.08%. Europe, which imports the energy, priced the weekend as a non-event.

12 Overnight setup — what Asia opens into

INSTRUMENT	LEVEL	CHANGE	VOLUME	STATUS
S&P 500 fut (@SP.1)	7,710.25	▼ 0.15%	137,587	Monday holiday session
Nasdaq 100 fut (@ND.1)	29,609.00	▲ 0.15%	88,638	Monday holiday session
Dow fut (@DJ.1)	53,117.00	▼ 0.60%	10,982	Thin — treat as colour
Russell 2000 fut	—	—	—	Not captured this run
USD/JPY	154.33	◆ noise	1,579	Live, bar ~70 min old
USD/KRW	1,345.00	◆ noise	221	Live, bar ~70 min old
USD/TWD	31.505	◆ noise	5	Live but 5 ticks — effectively no market

USD/CNH	6.7093	◆ noise	194	Live, bar ~70 min old
EUR/USD	1.1623	◆ noise	526	Live, 5-pip range since roll
Gold spot	4,411.72	▲ 0.16%	—	Live, full Monday session
Silver spot	66.3056	▲ 0.25%	—	Live, no high/low returned
Copper (front future)	6.706	▲ 0.35%	14,685	Live, spot unavailable
WTI (CL1)	92.61	▲ 1.24%	98,640	Live, full session
Brent (BZ1)	97.27	▲ 1.03%	20,137	Live to 14:29 ET
Bitcoin	79,185.97	▼ 0.80%	—	Live, traded all weekend
Ether	2,489.81	▼ 0.04%	—	Live, traded all weekend

- **The US tape hands over semiconductors, and Asia has already taken them.** Friday's memory rally drove Korea and Taiwan sharply higher on Monday while the US was shut: **Kospi +4.61% to 6,995.39**, Taiwan +1.67% to 47,326.27, Nikkei +2.12% to 66,399.84. These are **Monday closes, not live prints**.
- **Korea is the instrument most likely to move.** A 4.61% single-day gain leaves the Kospi needing either confirmation or a give-back, and it has no US cash session to take its cue from — the last US close it saw is now four days old. It is also the market Hedgeye named as near the top of its list for incremental shorts.
- **Hong Kong and China went the other way on Monday.** Hang Seng -0.93% to 25,413.12, Shanghai Composite +0.07% to 3,932.699. The memory bid did not travel to mainland or Hong Kong listings, which is consistent with it being a specific AI-memory supply-chain trade rather than a broad Asian risk-on.
- **Japan opens with a weaker yen and a two-day-old 2.12% gain to defend.** USD/JPY at 154.33 is supportive of exporters, but the level is what matters this morning, not the change.
- **Nothing in the overnight tape argues for a gap.** US futures are split 75bp between the Dow and the Nasdaq on holiday volumes, the dollar is softer, oil is higher. Asia opens into a market that has not yet had a session in which to price either the weekend's geopolitics or the hike debate.

Asian and European index levels are Monday 7 September closes. Percentage changes for Nikkei, Kospi and the Asian indices are press-sourced: the price vendor returned the correct closing levels but a null change field for the Asian and Australian indices, so the levels are two-source and the percentages are single-source.

13 AI watch

- **The AI trade has physically relocated from compute to memory.** DRAM contract prices are forecast up more than 50% this quarter and NAND around 60%. The stated driver is that AI context lengths are growing roughly 30x per year while memory content per server has only doubled in three years — a structural shortage rather than a cycle.
- **That relocation is showing up as a factor unwind, not a rally.** High Beta Momentum, defined by Hedgeye as long semis versus short software, is said to have crashed 77% from its June peak, while long AI-software versus short-semis gained 17.9% over the month to 4 September. Friday reversed that hard in a single session.
- **Nvidia is no longer the whole trade.** It rose 0.84% on Friday while Micron rose 6.10%, AMD 4.69% and Intel 4.51%. Nvidia remains the largest company in this brief at \$5.552tn, but it was not where the money went.
- **Software is the losing leg and it is low in its band.** IGV closed at 104.57, 23.4% of a 102-113 range, after falling 2.23%. Microsoft, its heaviest constituent, closed below 500 on its low.
- **Oracle's report tonight is the AI-capex read.** It is the largest AI-adjacent enterprise name reporting this week, and it carries an unusual amount of debt financing against that build-out — which makes it a joint test of AI demand and of what higher rates do to the companies funding AI infrastructure.

14 Beyond the markets

- **A 4.61% single-day move in a G20 equity index passed almost without comment** because it happened on a day the US was shut. Korea's Monday was larger than any single-day move in the S&P this year, and the brief that covers it is the first one written after it.
- **The Dow fell 0.60% overnight on 10,982 contracts.** That is roughly one-thirteenth of the S&P future's volume. Prices printed on volumes that low become the reference level for the next session regardless of how few people set them.
- **Three sources of copper price exist and they disagree enough to change a conclusion.** Copper at 6.706 on futures reads as at-the-ceiling against a band published on spot. The whole difference between 'pressing the ceiling' and 'through the ceiling' sits inside a basis nobody quotes.
- **Utilities rose on a day the ten-year touched 4.812%.** Every framework in this brief says that should not happen. It is one session and probably positioning — but it is also the kind of thing that is obvious in hindsight and invisible now.
- **The market is debating a rate rise with unemployment at 4.1% and inflation at 3.4%.** Two years ago that combination would have been described as a soft landing achieved. It is now the setup for tightening.

15 Appendix — stock cards

NVDA · NVIDIA

230.36 ▲ +0.84%

Cap \$5.552tn · range 229.63–234.76 · vol 123.3m · AH 229.49

Largest company in the brief and one of only two Mag7 gainers, but it lagged the memory names badly. Closed nearer the low of its range than the high. Named on Friday's Macro Show as a long alongside Microsoft.

MU · MICRON

1,016.59 ▲ +6.10%

Range 969.00–1,017.77 · vol 32.5m · AH 1,014.91

Closed within 1.18 of its high. The purest expression of the DRAM contract-price forecast. Hedgeye is explicitly short DRAM and holds zero semiconductor exposure, making this the single most adverse print in the feed.

TSLA · TESLA

354.08 ▼ –5.92%

Cap \$1.398tn · range 351.32–364.69 · vol 60.4m · AH 352.89

Worst large-cap of the session. Cybercab launch underwhelmed and the NHTSA opened an audit of Tesla's self-certification of a vehicle with no steering wheel, pedals or mirrors. Closed at 21% of its range and slipped further after hours.

ORCL · ORACLE

158.78 ▲ +3.08%Range 156.71–159.70 · vol 24.2m · AH 159.70 · **reports today**

Reports after tonight's US close — the week's first real catalyst. Rose 5.7% on Thursday on dovish Fed commentary, so it is directly geared to the hike debate. Heavy bond issuance against AI build-out makes it a leveraged read on both AI demand and funding costs.

NFLX · NETFLIX

78.25 ▼ –5.35%

Range 78.23–82.69 · vol 38.6m · AH 78.32

Closed 0.02 off its low. The longest-duration earnings stream in large-cap media, hit hardest by the rate repricing, compounded by a mixed reception to European price rises. Reported down 14% across 2026.

AMD · AMD

477.57 ▲ +4.69%

Range 458.00–478.83 · vol 18.2m · AH 476.24

Closed near its high on the memory and semi bid. Note the tension: Hedgeye added AMD Option Income (AMDY) to its bearish list on 2 September, two sessions before this move.

PLTR · PALANTIR

174.33 ▼ –4.49%

Range 173.67–182.19 · vol 25.2m · AH 174.40

Closed at 4% of its range — effectively on the low, and a 4.7% round trip from the high. The clearest single-name read on the high-beta momentum unwind Hedgeye says has run 77% from June.

INTC · INTEL

95.80 ▲ +4.51%

Range 91.87–95.94 · vol 86.6m · AH 95.89

Heaviest volume of any name captured at 86.6m shares, closing 0.14 off its high. Volume of that size on a 4.5% up day is accumulation, not a squeeze artefact.

All prices are Friday 4 September closes; after-hours prints are Friday's post-close and are now roughly 98 hours old. Next key dates are confirmed only for Oracle; other names carry no confirmed date this run.

16 About this edition

- **Covers** — the Friday 4 September US cash settle (the last session there was; Monday 7 September was Labor Day and US cash equity and bond markets were shut), Monday's abbreviated Globex and commodity sessions, the weekend news flow, and the overnight tape to 06:10 GMT+8 on Tuesday 8 September.
- **Captured — 06:07:19 to 06:10:07 GMT+8, a 2 minute 48 second window.** The standard capture script failed on both of its sources this morning; prices were recovered from a third vendor's exchange quote service. Divergences and single-source rows are reconciled in section 18.
- **Unusual about this run** — the primary capture returned nothing at all. TradingView answered HTTP 403 for all 96 instruments and Yahoo tripped its 429 circuit breaker in 2.2 seconds, so the run is **single-machine-sourced** off a fallback vendor, with press and Hedgeye figures as the independent cross-check. Two vendor bars came back structurally broken (SOX and the 2-year) and are flagged in place.
- **Settled vs live** — cash equities, sectors, single stocks and cash Treasury yields are **Friday settles, roughly 98 hours old**. Equity index futures are Monday's holiday session with the last print at the 18:00 ET reopen. Energy, metals, the dollar index and crypto are **live**. Spot FX pairs are live but their bars are only ~70 minutes old and their change figures are noise.
- **Hedgeye edition** — full subscriber access reached. The live risk-range set is the Early Look "*#Quad2 Then #Quad2?*" by **Keith McCullough, published Friday 4 September 07:40 ET / 19:40 GMT+8**. Hedgeye published no Early Look on Monday because of the holiday, so this set is live for a third consecutive edition and is superseded by today's Early Look at roughly 19:40 GMT+8. Also read: the Macro Show summary notes of 4 September, ETF Pro Plus published Monday 7 September, Signal Strength Stocks of 4 September, and the Macro Week Summary Notes landing page.

- **Quad path — CHANGED, and flagged loudly.** The Early Look raised the probability of **back-to-back monthly Quad 2s in September and October**, displacing a prior Quad 1 in September. December and January were already Quad 2, described as four Quad 2 months in five. The dashboard still prints US Monthly as Quad 1 — the shift is forecast, not booked. No explicit path notation was printed.
- **Not available** — the MOMO Tracker, KM's Top 3, Chart of the Day, Crypto Quant and Capital Allocation Pro did not appear in the feed since the last edition. "NFP | Mad Technology" (4 September 13:10 ET) is outside this account's entitlements and was not read. The Macro Week Summary Notes body sits in a PDF whose page 2 — which carries the forward path — remains unreachable.

17 Sources

Prices. CNBC's exchange quote service, queried in five batches between 06:07:19 and 06:10:07 GMT+8, supplying cash indices, futures, cash Treasury yields, spot and futures metals, spot FX, crypto, the eleven sector SPDRs, single stocks and market capitalisations. TradingView and Yahoo Finance were both attempted first via the standard capture script and both failed — 403 and 429 respectively.

Hedgeye. The authenticated subscriber feed at app.hedgeye.com, read at approximately 06:08-06:13 GMT+8: the Early Look category page, the full research feed, the Macro Show summary notes of 4 September, ETF Pro Plus of 7 September, Signal Strength Stocks of 4 September and the Macro Week Summary Notes index. The quarterly and global Quad readings and the VIX gauge are carried forward from this brief's own state record of the 4 September Macro Week Notes, which have not been republished.

Macro and policy. The Bureau of Labor Statistics for the CPI release schedule and the July CPI detail; press coverage of the Labor Department's August employment report for the payroll and unemployment figures; published FOMC scheduling and market-implied rate probabilities reported by Chase, ATRX and Coingape, which differed and are reported as a range.

Session narrative and single stocks. TheStreet, Yahoo Finance, CNBC, NBC News and the Washington Post index wrap for the Friday session; Motley Fool and 24/7 Wall St for Tesla, Palantir and Netflix; Invezz, Blockonomi and TradingKey for the memory complex; published weekly event calendars from eOption, Investrade and Kiplinger for the week ahead.

Commodities, geopolitics and AI. Bloomberg's oil market coverage and CNBC's 7 September market report for the Hormuz tanker attacks, Brent's move and the Asian and European closes; Susquehanna and TechInsights forecasts as reported for DRAM and NAND contract pricing. Claims by Iran and the United States about the weekend attacks are attributed to those parties and were not independently confirmed.

18 Data-confidence

Cross-checks passed

- **Cash index arithmetic is self-consistent for every index printed.** S&P: $7,747.71 - 29.11 = 7,718.60$, and $-29.11/7,747.71 = -0.3757\%$, printed as -0.38% . Nasdaq: $26,584.06 - 77.07 = 26,506.99$, -0.2899% . Dow: $53,686.11 - 271.86 = 53,414.25$, -0.5064% . Nasdaq 100: $29,482.32 + 61.835 = 29,544.155$. Equal-weight S&P: $8,902.08 - 45.77 = 8,856.31$, -0.5141% .
- **The ten-year yield reconciles across two independent vendor symbols.** The cash yield series returned 4.784% and the yield-index series returned 47.84 (+10 = 4.784%) — an exact match, from different feeds within the same vendor. This matters because last month's brief inferred the 2-year circularly from Hedgeye's own spread; the yields here are directly captured.
- **Friday's sector ranking reconciles against independent press reporting.** Wire coverage named Technology, Industrials and Utilities as the day's winners and Health Care, Consumer Discretionary, Communications and Energy as the biggest losers. The captured SPDR closes give exactly that ordering: XLK +0.70, XLI +0.41, XLU +0.12 green; XLV -1.04, XLC -1.19, XLY -1.33, XLE -0.87 among the losers. This is a genuine second source on eleven rows.
- **The dollar's Monday move is two-source.** The dollar index returned -0.28% to 98.902 and the September dollar index future independently returned -0.26% to 98.89. Two separate instruments, same direction, 2bp apart.
- **Index levels reconcile against press-reported closes.** The S&P at 7,718.60 (-0.38%) and the Nasdaq at 26,506.99 (-0.29%) match the figures carried in Friday's index wrap coverage exactly. Palantir at 174.33 (-4.49%), Micron at 1,016.59 (+6.10%) and Netflix at 78.25 (-5.35%) each match a named secondary report to the cent.
- **Market capitalisations are internally consistent with price × implied share count** for all seven mega-caps, and the seven sum to \$23.757tn. Nvidia at \$5.552tn on a 230.36 price implies roughly 24.1bn shares, which is the correct order of magnitude; the same check passes for the other six.
- **Futures-versus-cash basis behaves.** The S&P September future settled Friday at 7,722.00 against cash of 7,718.60, a 3.40 premium — normal positive carry ten sessions from expiry. The Nasdaq future sits 64.85 above cash NDX and the CME Bitcoin future 144 above spot. No row is dislocated in a way that would suggest a mislabelled settle.

Known conflicts and weak marks

- **The 2-year yield is the sharpest conflict in this brief.** The vendor settle series gives 4.374%, 0.5bp below Thursday's 4.379%. Press coverage of the same session states the 2-year hit its highest level since January 2025. The vendor returned a bar with open, high and low all zero, so there is no intraday data to adjudicate. Both can be true — an intraday spike that settled flat — and the brief prints the settle as the number and attributes the intraday claim. **Do not use the 2-year for anything load-bearing today.**
- **The SOX daily change could not be verified and is not printed.** Two separate vendor symbol paths both returned 11,735.262 with a flat bar, zero volume and zero open/high/low. The level is corroborated across those paths and dated to 4 September; the daily percentage is not. SOXX +3.52% and SMH +2.61% are given as proxies. The derived statement that SOX sits 19.9% below its 22 June high of 14,655.29 rests on a single vendor 52-week field — **the conclusion is robust, the decimal is not.**

- **Copper's band position is measured on the wrong series and the error is material.** Hedgeye publishes against Copper *Spot*; the spot series was not reachable this morning, so 6.706 is the front NYMEX contract. That reads 98.7% of the 6.40–6.71 band. On a band only 0.31 wide, a basis of even 0.5% moves the position by roughly ten points and decides whether copper is at the ceiling or through it. Treat that single cell as indicative. By contrast gold and silver *were* measured on spot as published — the gold basis alone is 1.07% (futures 4,458.80 vs spot 4,411.72), which would have moved gold's read by roughly twelve points of band position had futures been used.
- **Gold's two series disagreed on direction over Monday.** Spot rose 0.16% while the December future fell 0.40%. This is almost certainly a settle-cutoff artefact rather than a real dislocation, but the brief reports spot as the number and prints the disagreement rather than hiding it.
- **Spot FX change figures are noise and are labelled as such.** Euro, yen, won, Taiwan dollar and offshore yuan all rolled their session at 17:00 ET and their bars are roughly seventy minutes old at capture. The euro's entire range is five pips; the Taiwan dollar traded five ticks. Levels are usable; the percentage changes carry no information and are printed as ♦ rather than as moves.
- **The rate-hike probability is a range, not a number.** Two sources gave 58.4% and 56% for a 25bp September hike. Both are Friday-dated. Fed funds futures traded through Monday's holiday session but no live reading was obtained, so the figure is presented as roughly 56–58% and as of Friday.
- **Asian index percentage changes are single-sourced.** The vendor returned correct Monday closing levels for the Nikkei, Kospi and ASX but a null change field, so +2.12% and +4.61% come from press reporting alone. The levels themselves (66,399.84 and 6,995.39) are vendor-sourced. Similarly the DAX was reported at –0.25% by press and –0.15% by the exchange feed; the exchange figure is used.
- **The Dow future's 0.60% fall sits on 10,982 contracts** — roughly one-thirteenth of the S&P future's volume. It is a real print but a thin one, and it is described in the text as directional colour rather than a firm mark.

Known gaps

- **Both primary price sources failed outright.** TradingView returned HTTP 403 for all 96 instruments across three endpoint and header variants — a network-layer block, not a symbol problem. Yahoo tripped its five-consecutive-429 circuit breaker in 2.2 seconds. A third route, Financial Modeling Prep, is present but plan-gated and refused every quote, commodity and forex endpoint. The run is therefore **single-machine-sourced**, with press and Hedgeye figures providing the only independent validation. That validation is real but it covers headline indices, sectors and a handful of single stocks — **it does not cover the futures, the FX levels, the spot metals or the crypto rows, which are single-sourced.**
- **No Russell 2000 future was captured.** The fallback vendor resolved no small-cap index future under any symbol tried. IWM's Friday close is the only small-cap mark, and it is a cash ETF settle, not an overnight level. Section 12's small-cap row is therefore empty rather than estimated.
- **No published consensus for August CPI was obtained.** This is the most consequential gap in the edition, because Friday's release is the week's single event and the miss is what will move the market. Hedgeye's own 3.55% Nowcast is given instead, clearly labelled as Hedgeye's number and not a street consensus.
- **Several Hedgeye publications simply did not appear.** The MOMO Tracker, KM's Top 3 / From The Desk, Chart of the Day, Crypto Quant and Capital Allocation Pro were absent from the feed since the last edition — consistent with a US market holiday. **Absence of a Hedgeye position change is not evidence there was none.** Those are precisely the publications that would carry an intraday position change, and none of them ran.
- **"NFP | Mad Technology" (4 September, 13:10 ET) is outside this account's entitlements.** Given its title it likely contains the fullest Hedgeye commentary on the payrolls print and the technology tape, and it was not read.
- **The forward Quad path notation remains unread** for a second consecutive edition. It sits on page 2 of the US Monthly Quad Forecast inside the Macro Week Summary Notes PDF; the browser's PDF viewer exposes no accessibility text and ignores synthetic paging. The quarterly and global Quads and the VIX gauge in section 4 are carried forward from the prior edition's record of that same 4 September document and are **four days old.**
- **Asian and European cash markets are closed at the time of capture**, so section 12 reports Monday closes for them and live prints only for futures, FX, commodities and crypto — as designed.

Timing & unverified

- **Capture window: 06:07:19 – 06:10:07 GMT+8, a spread of 2 minutes 48 seconds**, comfortably inside the ten-minute standard. Clock verified directly at capture: Tuesday 8 September 2026, 06:07:01 HKT, equal to Monday 7 September 18:07:01 EDT. The run fired on schedule.
- **The stalest rows in this brief are roughly 98 hours old.** US cash equities, all eleven sector SPDRs, every single stock, the market capitalisations and all five cash Treasury yields last traded at 16:00 ET on Friday 4 September. Nothing in the US cash market has printed since. Monday was Labor Day.
- **The freshest rows are minutes old.** Crypto traded continuously through the entire weekend and is the only genuinely uninterrupted market in the document. Energy, spot metals and the dollar index carry Monday's full holiday session. Equity index futures carry Monday's abbreviated session with their last print at the 18:00 ET reopen — about seven minutes before capture began.
- **Spot FX bars contain roughly seventy minutes of trading**, having rolled at 17:00 ET. Their levels are current; their change columns measure a holiday evening and are marked as noise rather than presented as moves.
- **Every risk range in section 4 will be superseded today at approximately 19:40 GMT+8**, when Hedgeye's Tuesday Early Look publishes — the first new set since Friday. The Quad 2 forecast in particular may be confirmed, extended or revised in that note.
- **US cash equity markets reopen at 21:30 GMT+8 today** into a four-session week, a 3-year note auction, and an Oracle report after the close. Everything in sections 1, 5, 7, 9 and 15 will be four days stale by the time that bell rings.
- **Verify live prices before acting on anything in this document.** The single-source capture, the two structurally broken vendor bars, and the copper series substitution all mean specific cells here carry more uncertainty than the decimal places suggest.
