

THE EQUITY EXPRESSION OF THE CHINA VALUE THESIS

The Reflation Without Credit

China's August data arrived in two halves that do not belong to the same economy. Factory-gate prices rose 3.8% on the year and industrial output grew 5.2%, beating forecasts. In the same month banks extended just Rmb60bn of new loans against a Rmb400bn consensus, retail sales grew 0.4%, and fixed-asset investment fell 7.2% over the first eight months. On 21 September the People's Bank of China left its benchmark lending rates unchanged for a sixteenth consecutive month. On Thursday, Donald Trump and Xi Jinping meet at the White House. The question facing anyone holding Chinese equities has changed shape: it is no longer whether China is cheap, but which China is being bought.

A reframe worth holding onto

The Heyokha Wiki's china-equities page, built overwhelmingly on 13D Research, argues that extreme pessimism is itself the opportunity — that Chinese stocks are in the early stages of a secular bull market and that the deep-value and high-dividend cohort has never missed a major A-share bull market. The reframe it offers is that the index nobody wants and the index everybody owns are not the same index: the growth cohort trades above 50x while the dividend cohort yields more than three times the risk-free rate. That is an internal view, not a forecast, and the page's own record shows the China book was the weakest cluster in the week to 13 September.

Method. External figures were verified by web search against dated published reporting — statistical bureau releases, central-bank data reports and company results announcements — and each is attributed with its as-of date. No market-data feed was available in this run, so index levels are given as reported closes and no live prices are quoted. Internal views come from the Heyokha Wiki page *china-equities* (created 23 June 2026, last reviewed 14 September 2026) and its source summaries, attributed to the named provider and never presented as verified fact.

Picture a vehicle plant on the edge of a Chinese city, and give it two ledgers. Last year almost everything it built was sold within a few hundred miles of the gate. This year the local dealerships are quiet — fewer buyers, fewer loans approved, purchases deferred another season — while the dock has never been busier. Same plant, same workers, same steel, and the steel now fetches a better price than it did a year ago. The export ledger is having its best year on record; the domestic ledger is having its worst. Both are honest accounts of the same building. Now ask what the plant is worth. Value it on the ledger that is growing and it looks cheap; value it on the ledger that is shrinking and it looks like a good business standing in a contracting town. The share price has to blend the two, and the market has not settled on the weights. That, rather than any valuation multiple, is what "Chinese equities" currently means.

THE STORY IN 60 SECONDS

+3.8%

Producer prices, August 2026, year on year — the rebound out of factory-gate deflation. CPI rose 0.8%.
NBS, 9 September 2026.

Rmb60bn

New bank loans in August, against a Rmb400bn consensus. M2 grew 7.5%, a 17-month low.
PBOC, 15 September 2026.

−2.3%

The Hang Seng Index year to date through 21 September 2026. It closed at 24,604 on 18 September.
ETF Trends watchlist, 21 September 2026.

WHAT ACTUALLY HAPPENED

Two data releases, nine days apart

On 9 September the National Bureau of Statistics reported that producer prices rose 3.8% year on year in August and 0.4% on the month, beating forecasts, with higher global commodity and energy costs doing much of the work. Consumer inflation reached 0.8%, up from 0.5% in July, led by non-food prices and a sharp rise in transport costs. For a country that spent the better part of three years in factory-gate deflation, this is not a trivial reading. Producer prices are the input to industrial profit margins, and the relationship between the two is among the more durable in Chinese macro data.

On 15 September the same bureau published the activity data, and the picture inverted. Industrial output grew 5.2%, quickening from 4.5% in July and ahead of a 4.8% consensus in a Reuters poll of 42 analysts. Retail sales grew 0.4%, slowing from 0.6% and missing a 0.8% forecast, with vehicle sales down 18.5% on the year — the largest single drag. Fixed-asset investment fell 7.2% in the first eight months, a deeper contraction than the 6.7% decline through July. The urban survey unemployment rate rose to 5.3% from 5.2%.

The same day brought the credit report, and it was the more consequential of the two. Chinese banks extended Rmb60bn of new loans in August. That is positive, and it follows a Rmb340bn contraction in July, so on one reading it is a recovery. But the consensus expectation was Rmb400bn, and the figure a year earlier was Rmb590bn. Aggregate financing for the first eight months came to Rmb23.91tn against an expected Rmb24.37tn. Broad money grew 7.5%, the slowest in seventeen months. Households and firms are not borrowing, and no amount of producer-price recovery changes that directly.

Six days later the People's Bank of China held the one-year loan prime rate at 3.00% and the five-year at 3.50%, the sixteenth consecutive month without a move. The hold was widely expected. It nonetheless sits awkwardly against one of the internal bull case's load-bearing pillars, which describes the PBOC as the only major central bank still expanding its balance sheet.

THE ESSENTIAL DISTINCTION

A rise in prices is not a rise in credit. China's factories have recovered pricing power; China's households and firms have not resumed borrowing. An equity market can be *repriced* by the first. It can only be *re-rated* by the second.

MECHANISM

Following one exported vehicle through the economics

1. The order is booked abroad

A dealer outside China places the order. Revenue is contracted in foreign currency and settled offshore. BYD exported roughly 792,000 vehicles in the first half of 2026, up 67.8%, about 44% of total sales.

→

2. It is built onshore, at better prices

Steel, cells, wages and logistics are bought in yuan. With PPI up 3.8%, output prices are rising against an input base that rose earlier — the margin arithmetic that lifted CATL's H1 gross profit 48%.

→

3. The profit lands in the accounts

The sale shows up in reported revenue and industrial-profit statistics. It supports the earnings line the bull case rests on. It does not add a domestic buyer, a domestic sale, or a domestic loan.

→

4. The wage does not become a loan

The worker is paid, and the wage goes to saving or debt repayment rather than a mortgage or a car loan. Credit does not expand, so the cycle does not compound. August new loans: Rmb60bn.

Mechanism illustrative, constructed to trace a single transaction; it is not a claim about any specific vehicle or contract. Export and profit figures from BYD and CATL first-half 2026 results announcements (28 August and 24 July 2026 respectively); PPI from the National Bureau of Statistics (9 September 2026); credit data from the People's Bank of China (released 15 September 2026).

All three figures: National Bureau of Statistics of China, August activity data released 15 September 2026, as reported by CNBC and Business Recorder.

THE CENTRAL COMPARISON

External demand against domestic demand

Bars are illustrative: lengths are scaled to the absolute size of each percentage change against the largest in the set, so they compare magnitudes, not comparable units. Green denotes externally driven or industrial measures, dark green national production measures, amber and red domestic demand measures. Sources: CATL H1 2026 results (24 July 2026); BYD H1 2026 results (28 August 2026); National Bureau of Statistics August releases (9 and 15 September 2026).

A USEFUL MENTAL MODEL

Treat "Chinese equities" as two portfolios wearing one name. The first is a claim on global demand, priced in foreign order books and freight rates. The second is a claim on domestic credit, priced in loans that are not being made. *Most disagreements about China are really disagreements about which of the two the speaker has in mind.*

THE SHIFT

What has actually changed

WHAT HAS CHANGED	WHAT IT LOOKS LIKE IN THE DATA	WHY IT CUTS BOTH WAYS
Factory-gate deflation has ended	PPI +3.8% year on year and +0.4% on the month in August 2026, beating forecasts, with energy a main driver (NBS, 9 September 2026)	Pricing power lifts industrial margins and reported profits. But energy-led PPI is a cost shock as well as a margin story, and it does nothing for the consumer whose real income it erodes.

Output growth supports the earnings case for listed industrials. It also means more goods chasing a

WHAT HAS CHANGED	WHAT IT LOOKS LIKE IN THE DATA	WHY IT CUTS BOTH WAYS
Production and consumption have decoupled	Industrial output +5.2% against retail sales +0.4% in the same month; vehicle sales −18.5% (NBS, 15 September 2026)	domestic buyer who is not there, which pushes supply abroad and invites the tariff response.
Credit has stopped transmitting	New loans Rmb60bn against Rmb400bn expected; aggregate financing Rmb23.91tn year to date against Rmb24.37tn expected; M2 +7.5%, a 17-month low (PBOC, 15 September 2026)	Weak credit keeps bond yields low, which flatters the discount rate applied to high-dividend equities. It also removes the mechanism by which a valuation re-rating has historically been financed.
Policy has chosen stability over stimulus	One-year LPR held at 3.00% and five-year at 3.50% on 21 September — the sixteenth consecutive hold	Rate stability protects the currency and the banking system's margins. It also confirms the objection that reflation is subordinate to other policy aims, which is exactly the internal bear case.
Corporate outcomes have split by end market	CATL H1 revenue +54.8% and net profit +42.0%; BYD H1 revenue −7.1% and net profit −20.5% with exports +67.8% (company results, 24 July and 28 August 2026)	Company-level evidence now discriminates between exporters and domestic sellers more sharply than any index label does. Index-level statements about "China" have become correspondingly less informative.
A policy event has been scheduled	Bessent and He Lifeng held preparatory talks in New York on 20 September ahead of a Trump–Xi White House summit on 24 September, covering tariffs, rare earths and AI (CNBC, 20 September 2026)	A constructive outcome would most benefit the export engine that is already working. A poor one would damage the only part of the economy currently carrying growth.

BOTH SIDES

Bull and bear, stated fairly

The bull case

- **The deflation that defined the bear case has broken.** PPI +3.8% and CPI +0.8% in August, both above forecast and both improved on July (NBS, 9 September 2026).
- **Production is accelerating, not fading.** Industrial output +5.2% in August against a 4.8% consensus and 4.5% in July (NBS, 15 September 2026).
- **The profit recovery is visible in accounts, not only aggregates.** CATL reported H1 revenue of Rmb276.9bn (+54.8%) and net profit of Rmb43.28bn (+42%), with energy-storage revenue +87.5% and gross profit +48% (24 July 2026).
- **Export share is a durable second engine.** BYD shipped about 792,000 vehicles abroad in H1, +67.8% and roughly 44% of sales (28 August 2026); Pop Mart grew H1 revenue 23.8% to Rmb17.17bn with Greater China up 47.3% (20 August 2026).
- **The value cohort is priced for almost nothing.** 13D reports the CSI Dividend Index yielding 5.3% against a 1.73% risk-free rate — the widest gap on its record — while ChiNext trades above 50x and the Star 50 above 100x. *Internal view, 13D WILTW, 2 July and 6 August 2026.*
- **The negotiating channel is open, not closed.** Scott Bessent called the 20 September talks with He Lifeng successful ahead of Thursday's summit (CNBC, 20 September 2026).

The bear case

- **Credit is not recovering.** New loans of Rmb60bn in August against a Rmb400bn consensus and Rmb590bn a year earlier, after July's Rmb340bn contraction; M2 +7.5%, a 17-month low (PBOC, released 15 September 2026).
- **The consumer has effectively stopped.** Retail sales +0.4% against a 0.8% forecast, decelerating from 0.6%, with vehicle sales −18.5% (NBS, 15 September 2026).
- **Investment is contracting and the contraction is widening.** Fixed-asset investment −7.2% over eight months against −6.7% through July; urban unemployment up to 5.3% (NBS, 15 September 2026).
- **Policy is not leaning into the weakness.** The LPR was held for a sixteenth consecutive month on 21 September, at 3.00% and 3.50%, as expected — which is itself the point.
- **The national champion is shrinking at home.** BYD H1 revenue −7.1% to Rmb344.8bn, net profit −20.5% to Rmb12.33bn, NEV sales −15.7%; exports softened the fall rather than reversing it (28 August 2026).
- **The market has not paid for the thesis.** Hang Seng −2.3% year to date through 21 September; the Wiki's own record shows the internal China book as the weakest cluster in the week to 13 September, with four separate proxies negative. *13D WATMTU, 13 September 2026.*

Sourcing note on the bear case: the Wiki's *china-equities* page carries a thin bear section — two substantive entries (Russell Napier's June 2026 debt-deflation "avoid" and Harry Dent's July 2026 demographic argument) and a "Contradictions" section that reads "None yet." Four of the six bear points above were therefore built from external macro releases and from the companies' own reported results rather than from the internal page.

WHERE THE ACCOUNTS DISAGREE

The unresolved conflict

The internal view and the external record part company on one specific question: whether Chinese monetary conditions are troughing or deteriorating. The Wiki's bull case names PBOC monetary expansion as a structural pillar — "the only major central bank still easing," expanding its balance sheet at the fastest pace in fourteen years — and 13D restated on 13 September that Chinese stocks are "in the early stages of a secular bull market." The external record for the same period shows M2 growth at a seventeen-month low, credit extension at roughly a seventh of consensus, and a sixteenth consecutive month without a policy rate cut. Russell Napier, writing in Solid Ground on 30 June 2026, reads that same evidence as debt deflation intensifying and concludes investors should not hold Chinese equities while reflation remains subordinate to other policy priorities. The page itself preserves both views with full attribution and resolves neither.

This edition does not resolve it either, because the two sides are measuring different things and both measurements hold up. 13D's evidence is a profit cycle, and the profit cycle is externally corroborated: PPI up, industrial output beating, CATL's margins expanding. Napier's evidence is a money cycle, and the money cycle is also externally corroborated: loans, aggregate financing and M2 all below expectation. The honest position is that China currently has a genuine earnings recovery sitting on top of a genuine credit contraction, and that historically these do not coexist for very long in either direction. Which one gives way is the question, and nothing in September's data answers it.

Limitation on the internal view. The *china-equities* page cites 87 sources, and the overwhelming majority are 13D Research WILTW and WATMTU issues running back to October 2022, with Greed & Fear (Christopher Wood, Jefferies) forming the second block. 13D has been consistently and publicly bullish on Chinese equities across that entire window. The bear case on the page rests on two entries from two providers — one Solid Ground issue and one HS Dent Forecast — and the page's own Contradictions section is empty. This is close to a single-house view with annotations, and it should be read as one.

DASHBOARD

What to watch from here

SIGNAL	PLAIN-ENGLISH READING	WHY IT MATTERS
The 24 September summit outcome	Whether tariffs, rare-earth flows and AI controls move in either direction after the Trump–Xi meeting	The export engine is the part of the economy currently generating growth. A tariff deterioration attacks the working half; a de-escalation extends it.
September credit data, due mid-October	Whether new loans return toward the Rmb400bn-plus range or stay near August's Rmb60bn	This is the single cleanest test of the Napier objection. Two more months near zero would make the debt-deflation reading very hard to argue against.
Retail sales and vehicle sales, October release	Whether the 0.4% print and the 18.5% vehicle decline mark a floor or a trend	Autos were the largest single drag in August. Domestic demand is where the internal deep-value consumer positioning is expressed.
The October LPR fixing	Whether the sixteen-month hold becomes seventeen	Another hold against this activity data would confirm that currency and banking-margin stability outrank reflation in the policy hierarchy.
PPI momentum versus energy prices	Whether producer-price gains persist once the energy contribution fades	

August's PPI beat was led by energy costs. Pricing power that survives a flat oil price is a different and far more useful signal.

Breadth in the dividend cohort

Whether high-yield and consumer-staples names participate, or whether turnover stays concentrated in a narrow growth cohort

13D's case rests on value participating; its own record notes A-share turnover concentration at multi-year highs and the China book as the weakest cluster in mid-September.

EXPRESSIONS

Three postures, not one answer

Own the external engine

Exporters, industrial-ecosystem licensors and companies whose growth is denominated in foreign order books. **The cost:** this is a position in global demand and trade policy rather than in China. It is the holding most directly exposed to a poor summit outcome, and it has already worked, so much of the operating improvement is in the reported numbers.

Own the domestic dividend

High-yield state enterprises and consumer staples, paid to wait against a low domestic risk-free rate. **The cost:** the credit data says the cycle you are waiting for has not turned. The internal record shows the CSI Dividend Index falling 10% in June 2026 alone, its largest monthly decline in a decade, so the yield does not remove the drawdown.

Hold nothing and watch the money

Napier's posture: stay out until loan growth, M2 and the policy rate change direction together. **The cost:** if the profit cycle re-rates the market before the credit cycle turns, the entire move is missed. 13D's counter-argument is that Chinese value has not missed a major A-share bull market in 2007, 2015 or 2021.

The companies named below are illustrative of the mechanisms discussed in this edition. They are NOT recommendations, and nothing here constitutes investment advice or a view on the suitability of any security for any investor.

1211 HK

BYD Company

H1 net profit -20.5%
28 Aug 2026

The clearest single illustration of the split. First-half revenue fell 7.1% to Rmb344.8bn and net profit 20.5% to Rmb12.33bn, on NEV sales down 15.7%. Yet exports rose 67.8% to roughly 792,000 units, about 44% of total volume, and the second-quarter sales decline narrowed to 3.2% from 30.0% in the first quarter. The company attributes much of the profit fall to foreign-exchange losses and maintains that core profitability is stable.

WATCH NEXT

Whether the fourth-quarter domestic decline keeps narrowing, or whether export share has to keep rising simply to hold volumes flat.

300750 CH

Contemporary Amperex Technology

H1 net profit +42.0%
24 Jul 2026

The counter-example. First-half revenue of Rmb276.9bn (+54.8%) and net profit of Rmb43.28bn (+42.0%), with gross profit up 48.0%. Power batteries contributed Rmb192.1bn at a 20.6% gross margin; energy storage grew 87.5% to Rmb53.3bn at a 24.0% margin — the higher-margin business is also the faster-growing one. The company declared an interim dividend of Rmb14.11 per ten shares and announced a buyback.

WATCH NEXT

Whether storage growth holds as grid-scale procurement cycles mature, and whether licensing income begins to show separately in the accounts.

700 HK

Tencent Holdings

Q2 revenue +11%
12 Aug 2026

Second-quarter revenue of Rmb204.8bn, up 11%, with marketing services up 22% to Rmb43.6bn on improved advertising models and domestic gaming up 17%. Net profit attributable to shareholders was Rmb56.0bn, up 0.7%; non-IFRS net profit rose 9% to Rmb68.4bn. Capital expenditure rose 176% to Rmb52.8bn, largely on computing capacity — a domestic consumer-facing business now carrying an AI infrastructure bill.

WATCH NEXT

Whether advertising growth outpaces the capex line, or whether the gap between reported and non-IFRS profit keeps widening.

9992 HK

Pop Mart International

H1 revenue +23.8%
20 Aug 2026

First-half revenue of Rmb17.17bn, up 23.8%, with adjusted net profit of Rmb5.16bn at a 30% margin and a 69.7% gross margin. Greater China revenue grew 47.3% to Rmb12.2bn. Six intellectual properties each generated more than Rmb1bn. The network reached 676 stores and 2,827 automated units. Growth decelerated sharply from the 75–80% reported for the first quarter, and a buyback was announced alongside the results.

WATCH NEXT

Whether the deceleration from first-quarter growth rates continues into the second half, and what it implies about discretionary spending.

2259 HK

Zijin Gold International

Added at 4% weight
20 Aug 2026 · internal

Internal view, not an external verification. The Wiki records that Christopher Wood removed JD.com and JD Health from the Greed & Fear China long-only portfolio on 20 August 2026, replacing them with this name and with the memory maker CXMT at 4% each. The direction is the message: out of consumer internet, whose demand base the same issue showed contracting, and into hard assets and semiconductors. No price or valuation for this security was independently verified in this run.

WATCH NEXT

Whether further hard-asset substitutions appear inside China books, which would mark the theme migrating from macro to allocation.

000333 CH

Midea Group

10.0% index weight
Jul 2026 · internal

Internal view, not an external verification. The Wiki records Midea as the largest single weight, at 10.0%, in 13D's Deep Value Consumer and Pharma Index, launched in July 2026 as an explicitly anti-AI-concentration holding. That index then fell 4.0% in the week to 13 September, the steepest decline among the four China proxies 13D tracks — the week punished precisely the positioning intended to be defensive. No company financials were independently verified in this run.

WATCH NEXT

Whether the deep-value consumer cohort decouples from AI-exposed markets, which is the premise the index was built on.

The bottom line

What was repriced in September was not China's growth rate but the composition of it. The market spent three years discounting deflation, and deflation has in fact ended at the factory gate: producer prices rose 3.8% in August and industrial output beat forecasts. What replaced the deflation discount was not a re-rating but a second discount, for a credit system that has stopped transmitting — Rmb60bn of new loans against a Rmb400bn expectation, M2 at a seventeen-month low, a sixteenth consecutive month without a rate cut, and an index down 2.3% on the year despite all of the good news on the production side.

The evidence points both ways, and this edition has not tried to force it into one direction. An earnings recovery carried by exports and pricing power is real, visible in CATL's accounts and BYD's export volumes. A credit contraction is equally real, visible in central-bank data that no company result can offset. The reasonable inference is narrower than either camp would like: returns from here are likely to be decided company by company and end market by end market rather than by any index-level view, and "China is cheap" has stopped carrying enough information to act on. The next test is dated — September credit data in

mid-October, read alongside whatever emerges from Thursday's summit. If loans stay near zero while exports face fresh tariffs, both engines are impaired at once, and that is the outcome neither case has priced.

Editorial note. This document is educational commentary prepared for internal use at Heyokha Brothers. It is not investment advice, not a recommendation, and not an offer or solicitation in respect of any security. Companies and instruments named are illustrative of the mechanisms discussed and are not recommendations. All external figures are attributed with an as-of date and were verified against dated published reporting at the time of writing; markets move and figures date. Internal material drawn from the Heyokha Brothers research Wiki represents the opinions of the named research providers, is labelled as a view rather than a forecast, and is never presented as verified fact. Where internal and external accounts conflict, the conflict is stated and left unresolved rather than adjudicated. Past performance is not a guide to future results.

Sources and update notes

Internal. Primary page: *china-equities* (theme, status active; created 23 June 2026, last reviewed 14 September 2026; 13,106 words; 87 cited sources). Sections used: Thesis; The bull case; the August 2026 dividend rotation; the July 2026 H1 value-stock trough and PBOC-bazooka scorecard; the July 2026 nominal-GDP inflection; Wood's 20 August portfolio rotation; the September 2026 export-boom entry; the 13 September weakest-cluster entry; Napier's June 2026 "avoid"; Dent's demographic bear case; Contradictions. Provider issues relied on: 13D WATMTU, 13 September 2026 (the secular-bull restatement and the four negative China proxies); 13D WILTW, 6 August 2026 (the dividend rotation, ChiNext above 50x, Star 50 above 100x, A-share turnover concentration); 13D WILTW, 2 July 2026 (the CSI Dividend yield gap at 5.3% against 1.73%, the H1 value trough, the Deep Value Consumer and Pharma Index and its Midea weight); 13D WILTW, 3 September 2026 (services, IP and medical-tourism exports); Greed & Fear, 20 August 2026 (Wood's China long-only rotation); Greed & Fear, 16 July 2026 (nominal GDP inflection); Solid Ground, 30 June 2026 (Napier's debt-deflation "avoid"); HS Dent Forecast, 1 July 2026 (the demographic bear case).

Limitation on the internal view. Provider concentration on this page is severe. Of 87 cited sources, the substantial majority are 13D Research issues published continuously since October 2022, during which 13D has held an unbroken bullish stance on Chinese equities; Greed & Fear is the second block. The entire internal bear case rests on two entries from two providers, and the page's own "Contradictions" section states "None yet." The internal material here should be read as a well-documented single-house position, not a survey of opinion.

(10) Pop Mart first-half 2026 revenue Rmb17.173bn (+23.8%), adjusted net profit Rmb5.16bn at a 30% margin, gross margin 69.7%, Greater China Rmb12.2bn (+47.3%), 676 stores and 2,827 automated units, six IPs above Rmb1bn each — company results, 20 August 2026, via PR Newswire, Morningstar and The Standard. (11) Scott Bessent described 20 September 2026 New York talks with Vice Premier He Lifeng, joined by Jamieson Greer, as successful ahead of a Trump–Xi White House summit on 24 September 2026 covering tariffs, rare earths and AI guardrails — CNBC and France 24, 20 September 2026.

Editorial choices in this automated run. Topic selection followed the standing hot-first, thirty-day-no-repeat rule. Sources published since 1 September 2026 were scored by recency, with a bonus for entities named in an issue headline. Gold, AI capex, critical minerals, oil and gas, and the Iran war all scored higher than China equities but were excluded on cooldown, having run on 26 August, 8 September, 21 September, 21 September and 27 August respectively. China equities was the highest-scoring eligible theme, carried by the 18 September CLSA *Bits & Pieces* on beaten-down Chinese names under national capitalism, the 17 September 13D WILTW, the 17 September *Greed & Fear*, and the 13 September WATMTU. Its last edition ran on 21 August 2026, thirty-two days ago, so it clears the cooldown window by two days — a narrow margin, and readers of last month's edition should expect overlap in the underlying thesis though not in the data. The cooldown check was run directly against the files in the HB Wiki Learning folder, so it is complete rather than inferred. The Wiki server was fully available, though several calls exceeded the token limit and were read selectively. No market-data feed was reachable, so every external figure comes from dated published reporting rather than a live quote. Where the internal page carried a figure that could not be independently verified — the CSI Dividend yield gap, the ChiNext and Star 50 multiples, the 13D index weights and weekly moves — it is labelled an internal view with its provider and date rather than presented as fact.
