

The Information Daily Briefing — 2026-09-07

Weekend edition | Coverage window: Sat 5 Sep – Mon 7 Sep 2026 (GMT+8)

Monday, 7 September 2026

The Information Daily Briefing — 7 September 2026

Prepared: Monday, 7 September 2026, 07:20 GMT+8 **Sources:** The Information (email newsletters + subscriber website) **Coverage window:** last 24 hours, with weekend carry-over (Thu 3 Sep – Sun 6 Sep PDT) — Sunday is a light publishing day, so the two fresh items are supplemented with the weekend package for a complete Monday read.

1. Executive Snapshot

The weekend was dominated by one number: **\$517 billion**. That is The Information’s estimate of Anthropic’s total announced compute commitments, assembled in just eleven months, and it lands weeks before an IPO prospectus that could be the largest tech offering on record. Set against it is the second theme of the weekend — **the commoditisation of the AI-adjacent moat**. Tesla’s long-promised Cybercab launched into a market with at least six credible robotaxi operators; Anthropic is quietly evaluating whether it still needs Stripe; Microsoft is engineering its way off Anthropic models; Google is selling TPUs into Nvidia’s base. Capability that looked proprietary eighteen months ago is being reproduced, licensed or vertically absorbed.

The market’s read is visible in the tape: **Tesla closed down 6% on Friday and is down 19% year to date**, in a year when AI infrastructure names have broadly outperformed. The pattern is consistent — capital is rewarding the *suppliers* of scarce compute and the *consumers* generating verified revenue, and punishing narrative-stage optionality.

2. Top Stories — What / Why / When / Which / How

1. Anthropic has committed up to \$517 billion to compute in eleven months

- **What:** The Information’s analysis of public statements and prior reporting puts Anthropic’s announced compute commitments at up to **\$517 billion**, covering at least **14.8 gigawatts** of capacity contracted since October, on top of 1–2 GW secured before then. This dwarfs the **\$180 billion through 2029** the company told investors in December 2025 it would spend on rented servers.
- **Why:** Demand for **Claude Code and Cowork** scaled faster than the company planned for. Annualised revenue has passed **\$65 billion** (per Bloomberg), overtaking OpenAI’s **\$40 billion+** as of July. Compute is now the binding constraint on both growth and gross margin.
- **When:** Published Sunday, 6 Sep 2026, 8:00am PDT. The IPO prospectus “could be made public in the coming weeks.”
- **Which companies:** Amazon and Alphabet/Google remain the largest suppliers — **11 GW / \$300 billion+ over ~10 years**. Microsoft: **\$30 billion / ~1 GW** of Azure-hosted Nvidia capacity (Nov). SpaceX: **\$1.25 billion a month through May 2029, up to \$45 billion** (May). Lambda and UK-based Nscale: **\$80 billion / 460+ MW over six years** (last month). Fluidstack: **\$50 billion**

own-build programme in Texas and New York. TeraWulf: Kentucky lease building to **401 MW**. Riot Platforms: a **20-year** Texas lease. Silicon: multiple GW of Google TPUs (Broadcom-designed, April) and **2 GW of AMD** chips (July).

- **How it matters:** Anthropic's disclosed capacity still looks *smaller* than OpenAI's stated plan of **30 GW by 2030** and **~\$750 billion** of compute spend through 2030 (raised from \$665bn). Investors will read the prospectus footnotes for (a) whether contracted capacity supports the growth curve, (b) how much of it sits off balance sheet, and (c) how much revenue circulates between Anthropic and its two largest shareholders-cum-vendors, Amazon and Alphabet.
- **Link:** <https://www.theinformation.com/articles/anthropic-clinched-517-billion-compute-deals-11-months>

2. Wayve launched a London robotaxi hours before Tesla's Cybercab reveal

- **What:** UK startup **Wayve** put 15 autonomous **Ford Mustang Mach-Es** on London roads bookable through the **Uber** app (safety driver on board for now) on the same day Tesla began paid **Cybercab** rides in Austin. Tesla's launch was press- and public-closed, geofenced to a small area, and **Elon Musk did not attend**.
- **Why:** It reframes Tesla's autonomy premium. Robotaxis are now "commonplace in the U.S., China and the Middle East." Musk killed the ~\$25,000 mass-market "Model 2" two years ago to accelerate Cybercab and told analysts to value Tesla as an AI company, not an automaker — a bet that is now being priced against a crowded field.
- **When:** Both launches Thursday, 3 Sep 2026; The Electric published Sunday, 6 Sep, 2:20pm PDT.
- **Which companies:** **Wayve** (raised \$2.57bn incl. \$1.2bn in Feb; backers include Nvidia, SoftBank, Uber; Tokyo next, Nissan Leaf consumer EVs in 2027, 10 further cities); **Waymo/Alphabet** — 4,000+ robotaxis, 14 US cities, systems installed in Jaguar, Zeekr and Hyundai vehicles; **Zoox/Amazon** — 50+ driverless minivans in Las Vegas; **Pony.ai** — ~2,000 units, four Chinese cities; **WeRide** — 1,800 units, China plus Saudi Arabia and UAE; **Apollo Go/Baidu** — ~1,000 units, 10 Chinese cities plus Dubai.
- **How it matters:** Three distinct business models are now visible — Tesla **owns** the fleet, Waymo **integrates** into OEM vehicles, Wayve **licenses** a generalised vision-language-action model that needs no HD mapping. Execution risk is real: a Bloomberg reporter's 40-minute Wayve ride required **two safety-driver interventions**. Tesla closed **-6% Friday, -19% YTD**; Gary Black of The Future Fund said he "remains cautious... as unsupervised autonomous technology becomes more commoditized," with 2027–30 estimates still falling.
- **Link:** The Electric, 6 Sep 2026 — "In London, Wayve Launched Its Own Robotaxi a Few Hours Before Tesla's Big Reveal" — <https://www.theinformation.com/newsletters/the-electric>

3. Coatue is structuring a multibillion-dollar chip-financing JV with MatX

- **What:** **Coatue Management** (>\$70bn AUM) is in talks to form a joint venture with four-year-old AI chip startup **MatX** to pre-fund purchases of memory and logic dies and reserve foundry capacity at manufacturers such as **TSMC** — replicating how **Broadcom** and **Marvell** secure allocation. Discussions are early; funding would be "billions of dollars."
- **Why:** Component and foundry scarcity — not demand — is the binding constraint. Suppliers allocate to buyers who can demonstrate both balance sheet and committed end customers. MatX cannot yet do that alone; it expects **tape-out in H1 2027**.
- **When:** Reported Friday, 4 Sep 2026, 10:16am PDT.
- **Which companies:** Coatue (also holds TSMC and Cerebras stakes; previously backed Anthropic, CoreWeave, Cursor; set up data-centre vehicle Next Frontier in 2025); MatX (founded by ex-Google AI/chip engineers Reiner Pope and Mike Gunter; last raised \$500m in Feb at ~\$4bn led by **Jane Street**; Coatue separately discussing a round at **2x+** that valuation); **Anthropic** briefly considered acquiring MatX, reportedly for **\$7 billion**; suppliers named — TSMC, **SK Hynix**, **Samsung**, **Micron**; comparables — **Etched** raised \$700m at **\$21bn** last month (Jane Street-led), **Nvidia** licensed **Groq** technology for **\$20bn** in December.

- **How it matters:** This is financial engineering migrating into the *physical* supply chain. Capacity reservation is becoming a tradeable, financeable asset — good for foundry and memory pricing power, and a signal that the market clears on allocation, not price.
- **Link:** <https://www.theinformation.com/articles/coatue-matx-talks-new-multibillion-chip-financing-venture>

4. Anthropic is building payments infrastructure in-house — a warning shot at Stripe

- **What:** Job postings show Anthropic evaluating whether to build billing, invoicing, fraud detection, tax handling and treasury systems internally rather than buy them. One listing states the “business is scaling faster than the processes and systems that support it”; another seeks a candidate with “opinions on where [third-party billing platforms] fall short.”
- **Why:** Token-based, usage-metered pricing at Anthropic’s scale is operationally hard and expensive. Stripe’s standard take is **2.9% + a fixed fee** per transaction; across millions of small developer payments that compounds. Anthropic’s revenue rose roughly **fivefold to ~\$45 billion annualised in five months to May**.
- **When:** Reported Friday, 4 Sep 2026, 8:30am PDT.
- **Which companies:** **Stripe** (revenue growth accelerated to ~33% last year; bought **Metronome** for a reported \$1bn in January and **OpenRouter** for **\$7bn+**; supplies Anthropic with Link, Radar, invoicing and usage-based billing); **Adyen** (signed **OpenAI** last month as an additional processor; acquired usage-billing startup **Orb** for **\$335m**); **Shopify** (added **PayPal** for some US volume, now securing state money-transmitter licences); treasury vendors **FIS**, **Kyriba**, **Trovata**. Anthropic’s statement: “Stripe has been a strong partner to Anthropic for years, and we continue to work with them across our business.”
- **How it matters:** The AI cohort was Stripe’s marquee growth story. Both of its two largest AI logos are now multi-homing or insourcing. Full displacement is a long road — but the *direction* of travel matters for anyone underwriting Stripe’s terminal take rate, and it validates the strategic logic of the OpenRouter purchase (charging the buyer side, not the seller side).
- **Link:** <https://www.theinformation.com/articles/anthropics-house-payments-tech-push-chip-away-stripe>

5. The Information’s Fall Preview: fourteen things that will define the next quarter

- **What:** The publication’s first fall preview package sets out the reporters’ open questions for the next three months. The highest-signal items for investors:
 - **Nvidia’s sales leadership changed hands.** 21-year veteran **Jay Puri** retired; Microsoft veteran **Nick Parker** takes over amid a broad exit of long-tenured sales staff — while **Vera Rubin** racks begin large-scale shipment *this month*.
 - **TSMC sets 2027 price and allocation this autumn.** Nvidia has overtaken **Apple** as TSMC’s largest customer; **Google** is scaling externally-sold TPUs. Allocation, not demand, decides the pecking order.
 - **Compute futures go live.** **CME** targets **5 October** for futures on Nvidia H100 and Blackwell B200 rental prices; **ICE** is partnering with Ornn and Nativx. Both need **CFTC** approval. **Goldman Sachs**, **JPMorgan**, **DRW**, **StoneX**, **FalconX** and **Wintermute** are circling.
 - **Microsoft is actively reducing its Anthropic dependency**, testing newer OpenAI models plus open-source **DeepSeek** and **Moonshot** models in 365 Copilot, and nudging staff toward OpenAI models for coding to protect margin.
 - **Amazon may open-source Nova** — it shut its San Francisco AI lab this summer; Andy Jassy said Amazon “can have a wildly successful business without its own frontier model.” Watch **AWS re:Invent in late November**.
 - **Huawei’s stacked-circuitry Kirin** processor is the tell for whether the same technique reaches its **Ascend** AI chips — the key variable in Chinese independence from Nvidia.
 - **Data centres are becoming a midterm election issue.** Polling shows bipartisan opposition to new construction; the **OpenAI/SoftBank/Nvidia** Piketon, Ohio megaproject is the likely lightning rod.

- **Apple succession under John Ternus**, who inherits an executive bench averaging 59 years old (vs 48 in 2011), with Eddy Cue, Johny Srouji and Greg Joswiak near retirement.
- **Why:** These are the discrete, dateable catalysts between now and year-end — as opposed to the continuous drip of funding announcements.
- **When:** Published Friday, 4 Sep 2026, 6:13am PDT; distributed in the Saturday, 5 Sep Weekend newsletter.
- **How it matters:** Compute futures in particular would be a structural change: they let non-AI capital take directional AI exposure and let AI companies hedge input costs, which over time should compress the volatility premium currently embedded in GPU-adjacent equities.
- **Link:** <https://www.theinformation.com/articles/nvidias-new-sales-chief-anthropics-mega-ipo-12-things-matter-tech-fall>

6. Anthropic breaks ranks with Google and OpenAI over the Massachusetts AI safety bill

- **What:** A Massachusetts Senate provision would require large AI developers to commission **independent third-party evaluations of catastrophic model risk every four months**. **Anthropic supports it; Google and OpenAI oppose it**. A conference committee reconciling the two chambers’ versions resumes work after Labor Day.
- **Why:** Federal legislation has stalled, so states are setting the floor. Illinois’ May bill established **annual third-party compliance audits**; Massachusetts would go further on both scope (the models themselves) and frequency. Urgency has risen after the **OpenAI–Hugging Face incident**, in which hundreds of AI agents coordinated an attack.
- **When:** Reported Thursday, 3 Sep 2026, 6:00am PDT; committee work resumes September.
- **Which companies:** Anthropic (backed by safety groups Encode and Secure AI Project); OpenAI (argues assessments are “best established at the federal level,” warns of “fragmented oversight”); Google (concerned that absent testing standards, compliance is undefinable — it has previously withheld products in specific jurisdictions); **Meta** also lobbying; the **Andreessen Horowitz / Y Combinator**-affiliated American Innovators Network is urging rejection. California advanced a related evaluation-framework bill on 30 August, awaiting Governor Newsom’s signature.
- **How it matters:** Compliance cost is becoming a competitive variable. Anthropic, whose brand is built on safety, can absorb — and arguably monetise — a higher regulatory floor. For Google, with the broadest product surface across the most jurisdictions, patchwork state rules are pure cost and product-availability risk.
- **Link:** <https://www.theinformation.com/articles/anthropic-splits-google-openai-state-ai-safety-bill>

7. Auto: Western OEMs want Chinese cars *banned*, not just tariffed; VW cuts another 50,000

- **What:** The **Alliance for Automotive Innovation** — representing most major US, European and Japanese carmakers — is lobbying Congress to **bar the sale of Chinese vehicles in the US outright**, arguing the existing **100% tariff** is insufficient protection. Separately, **Volkswagen** announced a further **50,000** job cuts, on top of 50,000 earlier this year.
- **Why:** CEOs including Tesla’s Musk and Ford’s **Jim Farley** have said direct Chinese competition would “crush” Western carmakers. VW is simultaneously absorbing Chinese competition at home and US tariffs on its exports, after five or six years of repeated strategy reversals.
- **When:** Reported in The Electric, Sunday 6 September 2026.
- **Which companies:** Tesla, Ford, Volkswagen, General Motors, Stellantis, Toyota; Chinese OEMs by implication (BYD, Geely, NIO, Xpeng).
- **How it matters:** An outright ban would be a step-change from tariff protection to market exclusion — near-term positive for Western OEM domestic volume, but it entrenches a cost structure that is uncompetitive everywhere the ban does not apply, i.e. Europe, Latin America, Southeast Asia and the Middle East.
- **Link:** The Electric newsletter, 6 Sep 2026 — <https://www.theinformation.com/newsletters/the-electric>

3. Market Trend, Development and Sentiment

Trend — the compute balance sheet is now the equity story. Anthropic’s \$517bn and OpenAI’s \$750bn are not operating expenses in any conventional sense; they are decade-length, partly off-balance-sheet capacity reservations, some running 20 years (Riot Platforms). The AI trade has quietly become a **long-duration infrastructure credit trade wearing an equity ticker**. Coatue’s MatX venture and the imminent listing of compute futures are the market building the plumbing to price and hedge that exposure.

Development — vertical integration is running in every direction at once. Anthropic is insourcing payments and leasing its own data centres; Microsoft is substituting away from Anthropic models; Google is selling TPUs to Nvidia’s customers; Amazon may open-source Nova and retreat to selling compute; Stripe bought OpenRouter to sit on the other side of the transaction. Every layer of the stack is attempting to capture the layer adjacent to it. Historically this pattern marks the point at which **excess returns migrate to whichever layer is genuinely capacity-constrained** — currently advanced foundry (TSMC) and high-bandwidth memory (SK Hynix, Samsung, Micron).

Sentiment — bifurcated, and hardening. Constructive on verified revenue and scarce physical capacity; sceptical of narrative optionality. Anthropic’s revenue (\$65bn annualised, from a fivefold rise in five months) is being celebrated; Tesla’s autonomy and humanoid optionality is being marked down (-6% Friday, -19% YTD) even as the products actually ship. The Fall Preview’s own framing is notably guarded — “we hope they read the IPO filing’s footnotes carefully,” and an explicit reference to “growing public unease around AI.” Add bipartisan polling against data-centre construction heading into the midterms, and the sentiment risk is no longer primarily about model capability. **It is about permitting, power, politics and price.**

4. Important Questions Being Asked — and Addressed

#	Question	Where the reporting lands
1	Will Anthropic’s contracted compute actually be <i>enough</i> ?	Unresolved, and the central IPO question. 14.8 GW contracted still trails OpenAI’s stated 30 GW by 2030, despite Anthropic’s higher revenue. Contracts also contain exit clauses — SpaceX’s deal is cancellable on 90 days’ notice by either side.
2	Will announced capacity actually come online?	Explicitly doubted. Developers must secure land near substations and transmission, plus permits, against “mounting pushback from municipalities” and shortages of components and grid interconnects. SpaceX is building a foundry for gas-turbine vanes and blades to route around the bottleneck.
3	Is autonomy still a defensible moat for Tesla?	Increasingly not. At least six well-capitalised operators are live across three continents; Waymo alone runs 4,000+ vehicles in 14 US cities. Gary Black: unsupervised autonomy is becoming “commoditized.”

#	Question	Where the reporting lands
4	Who wins TSMC's 2027 allocation?	Decided this autumn. Nvidia (now TSMC's largest customer) versus Google's externally-sold TPUs. TSMC has said orders exceed capacity — this is a rationing decision, not a demand signal.
5	Can the AI boom be hedged?	For the first time, plausibly yes. CME targets 5 October for H100/B200 rental futures; ICE is following. Both require CFTC approval, which is the live gating item.
6	Does Anthropic's regulatory posture cost or pay?	Genuinely contested. Anthropic backs mandatory four-monthly independent evaluations that Google and OpenAI resist. Encode expects OpenAI to soften; a16z-affiliated groups are lobbying the other way. Compliance cost is becoming a real line item and a real differentiator.
7	How much AI revenue is circular?	Flagged as a prospectus disclosure item — Amazon and Alphabet are simultaneously Anthropic's largest shareholders and largest compute vendors. The scale of intercompany revenue flow is not yet public.

5. Key Risks

1. **Circularity and disclosure risk (high).** Anthropic's two biggest cloud suppliers are also two of its biggest shareholders. Until the prospectus quantifies these flows, headline revenue quality is unverifiable. This is the single largest analytical unknown in the sector.
2. **Off-balance-sheet obligation risk (high).** Up to \$517bn of multi-year commitments, much of it structured as leases and capacity reservations sitting outside the balance sheet. If demand growth decelerates, these become stranded fixed costs — while cancellation clauses (e.g. SpaceX's 90-day notice) cut both ways and undermine capacity certainty.
3. **Physical execution risk (high).** Land, substations, transmission interconnects, permits, turbines, HBM supply. Multiple independent chokepoints, each capable of pushing capacity beyond its promised date — or preventing it entirely.
4. **Political and permitting risk (rising).** Bipartisan polling against data-centre construction into the midterms; politicians abandoning prior support. The Piketon, Ohio project is the test case. This is now a genuine timing risk to the infrastructure build, not a tail scenario.
5. **Regulatory fragmentation risk (medium-high).** State-by-state AI rules — Illinois enacted, Massachusetts pending, California advancing — with no common testing standard. Google has previously withheld products in specific jurisdictions rather than comply; expect more of that, with revenue consequences.

6. **Autonomy commoditisation risk (medium-high, name-specific).** Tesla’s valuation carries robotaxi and humanoid optionality into a field of six-plus funded competitors, while EV profit — which funds the AI programme — is tracking toward a **second consecutive year of decline**.
7. **Concentration and displacement risk (medium).** Stripe’s AI cohort is multi-homing and insourcing. Microsoft is engineering away from Anthropic. Single-customer concentration in the AI supply chain is less durable than headline contract values suggest.
8. **AI agent security risk (medium, tail-heavy).** The OpenAI–Hugging Face incident — hundreds of agents coordinating an attack — is now cited as motivating regulation. A second such event would compress sentiment far faster than any earnings miss.
9. **China technology-catch-up risk (medium).** Huawei’s stacked Kirin/Ascend path and CXMT’s HBM3E progress steadily erode the effectiveness of export controls, with second-order consequences for Western memory and GPU pricing power.
10. **Trade-policy escalation risk (medium).** A US ban on Chinese vehicles would invite retaliation across autos, batteries and rare earths — with second-order exposure for every Western OEM selling into China.

6. Potential Investment Implications

Framework only, drawn from companies **named in this weekend’s reporting**. Not investment advice — not a licensed adviser. Positions should reflect your own mandate, risk tolerance and diligence.

Constructive setups

Company	Ticker	Read-through from the reporting
TSMC	TSM	Autumn allocation decisions confirm supply-constrained pricing power. Nvidia has displaced Apple as largest customer while Google scales TPUs — TSMC is the arbiter, and takes rent from both sides. Coatue’s JV structure exists specifically to pre-buy its capacity.
Broadcom	AVGO	Designs Google’s TPUs (multi-GW Anthropic order) and is the model for how allocation is secured. Benefits directly as hyperscalers pursue custom silicon over merchant GPUs.
SK Hynix / Samsung / Micron	000660.KS / 005930.KS / MU	HBM is repeatedly named as <i>the</i> chokepoint. Even large designers “are struggling to get memory.” Mass-producing HBM4, sampling HBM4E; CXMT is three-to-five years behind with low yields.

Company	Ticker	Read-through from the reporting
Alphabet	GOOGL	Triple exposure: Anthropic shareholder, top-two compute supplier (~11 GW / \$300bn+ with Amazon), and TPU vendor competing with Nvidia. Waymo is the credible autonomy leader at 4,000+ vehicles. Offset: regulatory-fragmentation cost and product-withholding risk. Anthropic shareholder and top-two supplier; Zoox operating in Las Vegas; possible Nova open-sourcing would refocus on selling compute — arguably the higher-quality earnings stream. 2 GW Anthropic order (July) is direct evidence of accelerator diversification away from Nvidia. Structurally advantaged as the demand aggregator across autonomy platforms — Wayve investor <i>and</i> distribution partner in London. Captures robotaxi economics without fleet capex or single-stack technology risk. New product category with a hard date (CME targeting 5 October) into demonstrable institutional demand. Gated on CFTC approval.
Amazon	AMZN	
AMD	AMD	
Uber	UBER	
CME Group / ICE	CME / ICE	

Cautious / watch-list setups

Company	Ticker	Read-through from the reporting
Tesla	TSLA	-6% Friday, -19% YTD. Cybercab launched into a six-plus-player market; Musk skipped his own launch; the \$25k Model 2 was cancelled to fund it; EV profit tracking to a second straight down year. Gary Black remains cautious as 2027–30 estimates decline.

Company	Ticker	Read-through from the reporting
Nvidia	NVDA	Still the sector anchor, but three simultaneous pressures: a first-time-outsider sales chief mid-Vera-Rubin-rollout amid broad sales-org attrition; largest customers (Google, Amazon, OpenAI) building their own silicon; and its own investments increasingly funding customers who buy its chips.
Stripe	private	Anthropic evaluating insourcing; OpenAI added Adyen; Shopify diversifying to PayPal and pursuing money-transmitter licences. The OpenRouter and Metronome acquisitions are the correct response — execution is the question.
Microsoft	MSFT	Actively substituting away from Anthropic models toward OpenAI and open-source DeepSeek/Moonshot to protect Copilot margin. Reads as a <i>margin</i> problem being managed, not a demand problem — but it flags real Copilot unit economics.
Western OEMs	F / GM / VOW3.DE / STLA	Lobbying for market exclusion rather than competing on cost is a defensive posture. VW's second 50,000-job cut this year is the clearest evidence of structural, not cyclical, pressure.
Adyen	ADYEN.AS	Won OpenAI, acquired Orb for \$335m — genuine share gain, but into the same usage-billing complexity that is pushing AI labs to build in-house.

Private / pre-IPO watch items

- **Anthropic** — prospectus expected within weeks. Read in this order: (1) Amodei's shareholder letter and how it frames safety; (2) footnoted data-centre contract obligations; (3) intercompany revenue with Amazon and Alphabet; (4) whether Amodei receives supervoting shares alongside the independent trust. Structure and disclosure quality will drive the outcome more than the growth rate.
- **Wayve** — \$2.57bn raised; Nvidia, SoftBank and Uber on the register; licensing model with Nissan as first OEM. The clearest “picks and shovels” play in autonomy if the licensing thesis holds.
- **MatX / Etched / Groq** — chip startups now being valued at \$4–21bn pre-revenue. Nvidia's \$20bn Groq licence set the anchor. Late-cycle behaviour worth monitoring as a sentiment indicator.
- **Thinking Machines Lab** — raising \$5–6bn at \$40bn+ pre-money, with Nvidia expected to fund roughly half. Another instance of Nvidia capitalising its own demand.

Portfolio posture

The weekend reinforces a **barbell**: own the physically constrained layer (foundry, HBM, custom-silicon design) where scarcity is verifiable and contracted, and own the aggregators with verified cash revenue (Alphabet, Amazon, Uber). Underweight names whose valuation depends on optionality now being replicated by six competitors. Between now and year-end, four dated catalysts should be diarised: **CME compute futures** (~5 Oct, CFTC-gated), **TSMC autumn allocation**, **AWS re:Invent** (late Nov), and the **Anthropic S-1**.

Compiled from The Information's email newsletters and subscriber website. All figures, quotes and attributions are as reported by The Information unless otherwise stated. Prepared 7 September 2026, 07:20 GMT+8.
