

Daily Need to Know

Tuesday, 15 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — SETTLED 16:00 ET MON 14 SEP = 04:00 HKT · 2H 08M OLD			
S&P 500	7,619.98	▼ 37.00 · −0.48%	Range 7,592.28–7,647.99 on 2.90bn shares vs 2.81bn 10-day average. Closed 36.98 points below Tier 1 Alpha's 7,656 gamma flip line that McCullough named on air — below it, dealer hedging amplifies rather than dampens.
Nasdaq Composite	26,186.41	▼ 146.62 · −0.56%	Gapped down to 26,018.50 at the open, bottomed 25,992.55, closed 193.9 above the low. A recovery, not a rout — the damage was one sector deep.
Dow Jones	52,421.20	▼ 152.09 · −0.29%	Opened at the high (52,750.88) and never traded above it. Low 52,278.89.
Russell 2000	2,892.24	▼ 11.71 · −0.40%	Range 2,885.54–2,908.52. Hedgeye added a short here on the day (IWM) and the TREND signal is bearish.
Philadelphia SOX	11,131.29	▼ 692.71 · −5.86%	The session. A 400bp sector spread day inside a 48bp index day. Whole-day range 11,110.11–11,285.30 — it gapped down and never recovered. Now 24.0% below the 14,655.29 52-week high.
US INDEX FUTURES — CME SETTLES 17:00 ET = 05:00 HKT · 1H 08M OLD · GLOBEX REOPENED 06:00 HKT AND HAD TRADED 8 MINUTES AT CAPTURE; THE FEED HAD NOT ROLLED THE SESSION (SEE \$16)			
E-mini S&P (ES)	7,625.00	▼ 34.50 · −0.45%	1,830,561 lots vs 1,487,123 average (+23%). Basis to cash +5.02 (+0.066%) — normal, which confirms the row is a settle and not a mislabelled print.
E-mini Nasdaq (NQ)	29,152.25	▼ 234.75 · −0.80%	497,204 lots vs 513,719 — the only one of the four below average volume. The index that fell hardest attracted the least futures activity.
E-mini Dow (YM)	52,440	▼ 145 · −0.28%	80,151 lots vs 69,128. Basis +18.80 (+0.036%).
E-mini Russell (RTY)	2,894.10	▼ 10.40 · −0.36%	311,783 lots vs 190,638 — +63% above average, the heaviest relative volume of the four , on the index with the smallest move. Someone was repositioning small caps, not chasing them.
US RATES — CASH YIELD SETTLES · 1H 08M OLD			
UST 10-year	4.998%	▲ 2.9bp	Intraday high 5.012% is the 52-week high to the last decimal. The 10-year traded through 5% for the first time this cycle and closed 1.4bp back under it. McCullough put the top of his range at exactly 5.01% and the next level at ~5.29%.
UST 30-year	5.354%	▼ 0.2bp	The only tenor that fell. Range 5.315–5.385; 52-week high 5.424 still 7.0bp away. The long end refused to follow the front.
UST 5-year	4.831%	▲ 4.3bp	52-week high 4.940, 10.9bp above. The belly did the heavy lifting.
UST 2-year	4.668%	▲ 3.8bp	Intraday high 4.679% is the 52-week high exactly. Second fresh front-end cycle high in three sessions, into an FOMC that is priced to hike.
13-week bill	4.051%	▲ 3.9bp	Closed at the day's high. Still 9.8bp under its own 4.149 52-week high — the bill is the one instrument not yet fully pricing the hike.
ENERGY — NYMEX CONTINUOUS-CONTRACT SETTLES · 1H 08M OLD			
WTI crude (CL1)	\$101.39	▲ 1.34%	Touched \$104.95 and gave back \$3.56. Closed 86c off the low of a \$4.42 range. A +4.9% intraday high converted into a +1.3% settle is a rejection, not a breakout.
Brent (BZ1)	\$105.68	▲ 1.02%	Same shape, bigger: high \$109.78, settle \$4.10 lower. Bloomberg led on "Brent topped \$105"; the more useful number is the \$4.10 it could not hold.
Natural gas (NG1)	\$2.896	▲ 2.30%	Range 2.849–2.911, closed in the top third — the only energy contract that held its gain. Hedgeye cut its TREND signal here to neutral anyway.
RBOB gasoline (RB1)	\$3.3171	▲ 0.30%	High \$3.4603, settle 14.3c lower — a 4.1% intraday reversal , the sharpest give-back in the complex. Petrol is where the political pain sits eight weeks from the midterms.
METALS — SPOT LIVE AT 06:07:41–06:09:49 HKT · FUTURES ARE 1H 08M SETTLES			
Gold — spot	\$4,298.20	live · flat	Live at 06:07:41; 06:09:49 re-pull \$4,297.25. Futures (GC1) settled \$4,351.90, −1.29% , having traded \$4,293.00–4,396.80. Basis \$53.70 = 1.25% — measure Hedgeye's band on spot, not this.
Silver — spot	\$63.213	live · flat	Re-pull \$63.187. SI1 settled 64.138, −1.61%, low 62.80. Basis 1.46%. Hedgeye sold its entire silver position on 11 Sep; it has not returned.

Copper — spot	\$6.2892	live · flat	Re-pull \$6.2887. HG1 settled 6.4045, −2.19% . Basis 1.83%. Spot sits at 8.8% of Hedgeye's band — all but on the floor.
FX — DXY / KRW / TWD ARE SETTLES; EUR, JPY, CNH LIVE BUT ONLY ~1H INTO THE NEW SESSION			
Dollar index (DXY)	99.466	▲ 0.38%	Monday settle; range 99.073–99.736. Bearish TREND at Hedgeye and yet 75.5% of the band , pressing the top for a third session.
USD/JPY	154.331	live · noise	Range on the live session 154.277–154.345 on 2,132 ticks vs a 359,156 average. Any change figure here is a rounding error, not a move.
USD/KRW	1,346.61	▲ 0.38%	Monday Asian-hours settle, ~15h old. Range 1,341.56–1,348.64; closed near the weak end of won. Korea reopens into a further US semi leg it has not seen.
VOLATILITY AND CRYPTO — VIX SETTLED 16:15 ET; CRYPTO GENUINELY LIVE			
VIX	17.11	▲ 1.26 · +7.95%	Range 16.58–18.17; opened 17.50 and closed below the open. Back inside Hedgeye's band at 61.9% after two sessions above the ceiling. Nasdaq vol is the tell: VXN closed 22.05, nine hundredths under McCullough's 22.14 breakout trigger, having traded 24.02 intraday.
Bitcoin	\$78,720	▲ 2.46%	Live; 06:09:49 re-pull \$78,746.65. Range 76,365–79,555. 4.96% above McCullough's \$75,000 TRADE line , TREND 70,000. The one large asset that rose while AI equity risk was being cut. Ether \$2,547, +2.83%.

Colour key: ▲ green higher · ▼ red lower · ◆ amber flat, stale or noise-level. Reconciliation: every cash index row is arithmetically self-consistent — close, point change and implied prior close agree to five decimal places — and all four prior closes (SPX 7,656.98 · COMPQ 26,333.04 · RUT 2,903.94 · VIX 15.85) match the previous edition's recorded settles exactly. Futures-to-cash basis is normal on all three comparable pairs. Full detail in section 18.

TL;DR

The index did nothing and the market did everything. The S&P fell 0.48% while the Philadelphia semiconductor index fell 5.86% and communication services rose 2.19% — a 400 basis point spread between the best and worst S&P sector on a day the index moved less than half a percent. The trigger was not a data point: Anthropic's Dario Amodei called publicly for slower AI development, Sam Altman and Elon Musk agreed, and Altman said OpenAI would not list this year. Capital left the chips that build the models and went into the software the models were supposed to destroy — Adobe +5.30%, Workday +4.58%, Netflix +3.77%, Alphabet +3.22%.

Underneath it, the bond market did the thing everyone has been waiting for. The 10-year traded 5.012% — its 52-week high to the decimal, and the first 5% print of this cycle — and closed 4.998%. The 2-year made its own fresh cycle high at 4.679%. The 30-year fell. The curve flattened to 33.0bp. The Fed decides on Wednesday with a 25bp hike priced at 79–90%, which would be the first since 2023.

And the energy trade broke while crude was still up. WTI touched \$104.95 and settled \$101.39; Brent gave back \$4.10 from its high; RBOB reversed 4.1%. Oil services (OIH) fell 4.42% and closed **below Hedgeye's 415 floor** — a position Hedgeye is long. Hedgeye cut four TREND signals to neutral in one night (Nasdaq Composite, nat gas, gold, copper) and upgraded none.

2 The big picture — what it means

1. A 5.86% move in semiconductors inside a 0.48% move in the index is a rotation, not a de-risking. If Monday had been a risk-off day the equal-weight S&P would have fallen with the cap-weight. It did not: RSP closed **+0.07%**. Three sectors rose, eight fell, and the winners were communication services (+2.19%), health care (+1.45%) and staples (+1.25%) — one growth, two defensive. Money did not leave equities. It moved from the part of the market that is long the AI capex cycle to the part that is short it.

2. The catalyst was a statement about the technology, not about the earnings. Amodei argued that AI agents could within six to twelve months be capable of taking over the internet and causing hundreds of billions of dollars of damage, and asked the industry to slow down. Altman and Musk endorsed it; Altman added that OpenAI would not IPO this year because "right now would be an ill-advised moment to go public". Nothing in that changes a single chip order. What it changes is the terminal growth rate the market has been capitalising, and it came from the three people with the most to lose from saying it. SoftBank fell 10.7% in Tokyo. Nvidia lost 3.36% — roughly **\$177bn of market capitalisation** — and was removed from Hedgeye's Signal Strength list the same morning.

3. The software rally is the cleanest read of what was actually repriced. Adobe, Workday, Netflix, Alphabet, Microsoft and Meta all rose. These are the names that have been marked down all year on the thesis that capable agents would eat enterprise software. If frontier progress slows, the incumbents get time. That is a coherent, tradeable inversion — and it is why Hedgeye stayed long software (IGV) while explicitly refusing to touch semis. McCullough's line on the tape: "I don't chase."

4. The 5% print on the 10-year is the more durable story, and it is being driven by oil. Every tenor from 3-month to 5-year rose; only the 30-year fell. 2s10s flattened to **33.0bp** from 37.5bp on Thursday, 2s30s to 68.6bp. That is not a growth scare and it is not a term-premium story — it is the front end pricing a central bank that has to respond to a supply-side inflation impulse. August CPI, released Friday, printed headline +0.4% m/m and 3.4% y/y

with **core +0.3% versus +0.2% expected**, and gasoline alone contributed more than a third of the headline gain. McCullough's framing: "Bessent has lost control of the bond market, or never really had it."

5. Energy topped out intraday and nobody is talking about it. Crude was up all day and the equity expression of crude was down all day. XLE fell 0.94% and closed 35c off its low after opening within 22c of its 52-week high. OIH fell 4.42%. This is the third consecutive session in which the energy complex has shown distribution on strength — the 10 Sep edition flagged XLE printing a 52-week high and closing down 0.58%, and it has now happened again with more force. Either crude comes back to the equities or the equities are telling you \$105 Brent does not hold.

6. Hedgeye downgraded four TREND signals in one night and upgraded none. Nasdaq Composite bullish→neutral, natural gas bullish→neutral, gold bullish→neutral, copper bullish→neutral. On top of that, ETF Pro Plus made eight changes on Monday — adding shorts in US small caps (IWM), Australia (EWA) and Switzerland (EWL), removing longs in Spain, physical uranium, **gold miners (GDX)** and South Africa, and covering the dollar short. Signal Strength Stocks fell from 61 names on 9 September to **46**, with Nvidia, Marvell, JPMorgan and Newmont all removed. On air McCullough put the internal count at 52 longs against 73 shorts, from a long list that was above 90.

7. The week's structure is unusually loaded and the gamma is on the wrong side. The Fed decides Wednesday 14:00 ET (Thursday 02:00 HKT) under Chair Kevin Warsh, with a 25bp hike carrying 79–90% in prediction and futures markets. Quadruple witching falls on Friday 18 September, two days later. The S&P closed **below** the 7,656 gamma flip line McCullough cited from Tier 1 Alpha, which means dealers are short gamma into both events. VXN at 22.05 sits 0.4% under the level he named as the Nasdaq volatility breakout. Those three facts are the setup; the AI headline was the spark.

3 Rates, currencies & commodities

- **The 5% touch was real and brief.** UST 10-year traded 4.934–5.012% and settled 4.998%, +2.9bp. The 5.012% high is the 52-week high to the last decimal — the first time this cycle the benchmark has printed a 5-handle. It closed back below, which is the distinction between a level being tested and a level being taken.
- **The front end is doing the hiking.** 2-year +3.8bp to 4.668% with an intraday 4.679% that is itself a fresh 52-week high; 5-year +4.3bp to 4.831%; 13-week bill +3.9bp to 4.051%, closing on its high. The 30-year fell 0.2bp. A curve that flattens into a hike is the market saying the hike is a policy error it will have to undo — 2s10s 33.0bp, the flattest of the cycle.
- **Bond volatility is grinding, not spiking.** MOVE +2.06% to 83.90, closing at its own intraday high, having opened at its low. That is a clean one-way session in rate vol and it sits well below the 115.02 52-week high — this is repricing, not dislocation.
- **Credit made three fresh 52-week lows and then bounced.** HYG traded 78.41 (52-week low exactly) and closed 78.53, –0.09%. LQD traded 104.05 (52-week low exactly) and closed 104.30, –0.02%. TLT traded 80.46 (52-week low exactly) and closed **+0.07%**. All three volumes above average — HYG 44.1m vs 36.4m, LQD 30.9m vs 27.5m, TLT 33.7m vs 30.2m. Three simultaneous 52-week lows reversed on heavy volume is a buyer showing up, and McCullough said on Thursday he had already cut his rate-sensitive shorts to minimum size.
- **Crude rejected the highs across the whole board.** WTI –\$3.56 from the high, Brent –\$4.10, RBOB –14.3c (a 4.1% reversal). Only nat gas held, +2.30% and closing in the top third of its range. Hedgeye's WTI band was chased up hard again — floor +\$1.93, ceiling +\$2.75 — and price still settled at 71.6% of it, well inside, for the first time in three sessions.
- **The dollar is a problem for the bearish call.** DXY +0.38% to 99.466, a third session pressing the upper half, now 75.5% of a band Hedgeye has labelled bearish. ETF Pro Plus **removed the short dollar position** (UUP) on Monday — the signal was covered rather than defended. Won weakened 0.38% to 1,346.61, Taiwan dollar 0.55% to 31.78. Offshore renminbi is the outlier at 6.7076, within 0.07% of a 52-week low — the strongest Chinese currency in a year, into an oil shock.
- **The monetary metals are still not participating.** Gold futures –1.29%, silver –1.61%, copper –2.19%, on a day crude rose. Gold miners fell 3.05% and were removed from the Hedgeye long book. A commodity complex led by energy while gold, silver and copper fall is a supply shock plus a tightening expectation — it is not an inflation-hedge bid, and it has now persisted for four sessions.

4 Hedgeye — regime, risk ranges & the Quad path

MACRO DASHBOARD

READING	CURRENT	SOURCE AND AGE
US Monthly Quad	Quad 2 — growth up, inflation up	Written confirmation 9 Sep Early Look, carried forward. Not restated in the 14 Sep note.
US Quarterly Quad	Quad 4 — growth down, inflation down	Macro Week Summary Notes dashboard dated 4 Sep, carried forward, now eleven days old and in open tension with the monthly read.
Global Quad		Carried forward.

	Quad 3 — growth down, inflation up	
Forward Quad path	Not observed	Lives on page 2 of the US Monthly Quad Forecast inside the Macro Week Summary Notes. The 11 Sep edition exists in the feed and its contents page lists the forecast, but the document itself is a PDF behind a secondary link that returns no extractable text. Sixth consecutive edition unable to read it. No path notation was seen this morning and none is asserted — absence of a printed path is not evidence the path is unchanged.
Regime language on air	"The Quad 4 crash resumed"	Macro Show, 14 Sep 23:02 GMT+8, applied specifically to South Korea and semiconductors rather than to the US.
Inflation nowcast	Rate of change still accelerating	Early Look, 14 Sep. The Monthly Inflation Nowcast product itself returns ACCESS DENIED on this account.

RISK RANGE™ SIGNALS — MONDAY 14 SEPTEMBER EARLY LOOK, MEASURED AGAINST THIS MORNING'S PRINTS

INSTRUMENT	IMMEDIATE-TERM RANGE	TREND	NOW	BAND MOVE VS 11 SEP	WHERE IT STANDS
UST 10-year yield	4.75 – 5.01%	bullish	4.998%	floor 0 · ceiling +3bp	95.4% . Ceiling raised 3bp and the intraday 5.012% high cleared it anyway. McCullough named 5.01% on air as the top and ~5.29% as the level beyond.
High Yield (HYG)	78.30 – 79.16	bearish	78.53	floor +0.05 · ceiling –0.04	26.7%. Band narrowed 9c. The 78.41 intraday low is a fresh 52-week low.
Inv. Grade Corp (LQD)	104.0 – 105.6	bearish	104.30	floor –0.10 · ceiling –0.20	18.7% — the band was lowered and price still sits in the bottom fifth. Low 104.05 = 52-week low.
S&P 500 (SPX)	7,569 – 7,747	bullish	7,619.98	floor +4 · ceiling +17	28.6%. Band raised 13 points wider into a down day. The operative level is not the band — it is the 7,656 gamma flip , which price closed below.
NASDAQ Comp (COMPQ)	25,710 – 26,512	neutral	26,186.41	floor –89 · ceiling +11	SIGNAL CUT bullish → neutral . Floor dropped 89 points and the band widened 100 — the classic shape of a signal being relaxed rather than defended. 59.4%.
Russell 2000 (RUT)	2,868 – 2,960	bearish	2,892.24	floor –7 · ceiling –10	26.3%. Both ends lowered a second consecutive session and Hedgeye added a new IWM short at 10:16 ET.
Health Care (XLV)	162 – 175	bullish	167.75	floor –1 · ceiling 0	44.2%, and it finally worked: +1.45% , second-best sector. The floor has now been cut in three of the last four sessions to keep this long inside.
Tech Software (IGV)	98 – 110	bullish	n/a	floor –1 · ceiling –1	Price not available — IGV remains outside the capture universe for a seventh consecutive edition . Directionally the call worked: Adobe +5.30%, Workday +4.58%, Salesforce and ServiceNow both reported higher.
Oil Services (OIH)	415 – 438	bullish	402.06	floor 0 · ceiling –2	–56.3% — \$12.94 BELOW the floor, a 3.1% breach, on a –4.42% day . Hedgeye is long this and ranks energy its number one sector. Price added independently this morning; it was not in the standard capture.
Volatility (VIX)	14.43 – 18.76	neutral	17.11	floor +0.10 · ceiling –0.01	61.9%. Back inside the band after two consecutive closes above the ceiling — that contradiction has now resolved in the band's favour.
US Dollar (USD)	98.50 – 99.78	bearish	99.466	floor +0.10 · ceiling +0.11	75.5%. Band raised a session after being cut, price still in the top quartile of a bearish signal. The UUP short was removed.
WTI crude — continuous	90.44 – 105.74	bullish	101.39	floor +1.93 · ceiling +2.75	Largest band chase in the table for a second session — width +0.82 to 15.30. Price settled 71.6% of band, back inside after two sessions clear of the ceiling. The 104.95 intraday high was 94.8% of band.
Nat gas — continuous	2.75 – 3.01	neutral	2.896	floor +0.04 ·	SIGNAL CUT bullish → neutral on the one energy contract that rose and held. 56.2%.

				ceiling +0.02	
Gold — spot	4,247 - 4,473	neutral	4,298.20	floor -28 · ceiling -30	SIGNAL CUT bullish → neutral and the whole band shifted down. 22.7%. Spot is \$81.80 below the \$4,380 momentum level McCullough requires before adding; the position is already at minimum size.
Copper — spot	6.24 - 6.80	neutral	6.2892	floor -0.11 · ceiling -0.04	SIGNAL CUT bullish → neutral and the floor was finally lowered, three sessions after the futures collapse. Even so: 8.8% — the most floor-pinned instrument in the table. On HG1 futures this row would misread 29.4%.
Silver — spot	60 - 65	bearish	63.213	floor -1 · ceiling -1	64.3%. Whole band stepped down a dollar. Hedgeye is flat silver and said so again on air.

Metals are measured on spot (TVC:GOLD, TVC:SILVER, OANDA:XCUUSD) and energy on the continuous contract (NYMEX:CL1!, NYMEX:NG1!), matching the series Hedgeye's published lines actually name. Band moves are one-session changes, Friday 11 September Early Look → Monday 14 September Early Look, diffed against the stored prior set rather than scraped — the Early Look category page does not paginate. **Four TREND signals were cut to neutral in a single night and none was raised.** The Tuesday 15 September Early Look, due ~19:30 GMT+8 today, supersedes every band above.

WHAT KEITH ACTUALLY SAID

From the **Early Look, "#MOAB In AI vs. The Cycle"**, Keith McCullough, published 14 Sep 07:31 EDT = **14 Sep 19:31 GMT+8**:

- "Welcome to another Macro Monday @Hedgeye where the proactively prepared will execute while Macro Tourists who were chasing Semis (again) last week will panic."
- "QQQ - fortunately, we're not long what the crowd is - QQQ was already signaling Bearish TRADE (so was SPY on Friday - that's why I sold every Long but 1 in Real-Time Alerts), so now The Question is does it break @Hedgeye TREND Signal Support like the Russell (IWM) already did? Alpha Code for QQQ = 720705 (TRADE = 720, TREND = 705) with #NazVol's (VXN) Breakout Signal Level = 22.14"
- "UST 2yr Yield shot +26 basis points higher to new Inflation Cycle Highs last week... UST 10yr Yield ramped +19 basis points higher to new Inflation Cycle Highs last week... Yield Curve continued to flatten, -7 basis points flatter, week-over-week"
- "As we reminded you when we reduced Gold to The Fam's MIN (minimum position size), Gold doesn't like the pace of inflation's acceleration."
- "The idea was never the bubble. The bubble is always the financing of the idea."

QQQ closed **709.18**. That is 10.82 below the 720 TRADE line and **4.18 — 0.59% — above the 705 TREND support** he named as the question of the week. VXN closed **22.05**, nine hundredths under the 22.14 breakout trigger, after trading as high as 24.02 intraday. Both levels were published before the session and both were tested within it.

From The Macro Show summary notes, 14 Sep 11:02 EDT = 14 Sep 23:02 GMT+8 — reported outside quotation marks because Hedgeye marks these notes "SUMMARY HAS BEEN ENHANCED BY AI AND MAY CONTAIN ERRORS" and carries its own error caveat:

- KOSPI failed the immediate-term trade level around 6,971 and fell more than 3%, taking it roughly **27% below** the June 2026 "Mother of All Bubbles" AI high. Hedgeye is back to bearish TRADE and TREND on both DRAM and KOSPI, and did not chase the semi bounce.
- Bessent has lost control of the bond market, or never really had it; the short end is rising faster, the curve is flattening, the economy is past its cycle peak. The Fed should have raised earlier so it would be positioned to cut later — the catalyst for future cuts may be that it hikes now and inverts the curve further. The curve is "getting pancaked".
- The Tier 1 Alpha SPX flip line is **7,656**; below it gamma goes negative and the selloff can become sharper. Complacent short-dated volatility and potential CTA selling are the amplifiers, especially for those chasing semis.
- Risk was cut, not added: silver sold on a TRADE and TREND break, copper miners sold, gold reduced to minimum after failing to reclaim 4,380, cash raised to its biggest position by selling what broke signal. Long the Canadian dollar as the only currency long; long Colombian equities and pesos; short India, China and Japan.
- Signal strength has deteriorated badly — 52 longs against 73 shorts, from a long list once above 90 — and the new shorts are increasingly cyclical consumer and industrial names, Shake Shack, Dine Brands and Tootsie Roll among them. Asked for the best semiconductor short, the room answered **Micron**.

POSITION CHANGES ON THE TAPE SINCE THE PREVIOUS EDITION

- **ETF Pro Plus, 14 Sep 10:16 EDT = 22:16 GMT+8 — eight changes, the largest single update in this brief's recent record.** Adding short: US small caps (IWM), Australia (EWA), Switzerland (EWL). Removing long: Spain (EWP) 61.07-63.13, physical uranium (SRUUF) 19.0-20.5, **gold miners (GDX) 93.0-105.0**, South Africa (EZA) 68.01-72.52. Removing short: US dollar bullish (UUP) 27.72-28.29.
- **Signal Strength Stocks, 14 Sep 11:17 EDT = 23:17 GMT+8 — 46 names, down from 61 on 9 September.** Added: CPAY, DELL. Removed: **JPM, MRVL, NVDA**, ABNB, RRGB, MNTN, FIVN, NEM.

- Portfolio Solutions daily ETF re-rank, 14 Sep 10:31 EDT: top movers COLO +13, IBIT +10, FXC +8 — Colombia, bitcoin and the Canadian dollar, exactly the three non-US longs McCullough defended on air. The item itself is outside this account's subscription tier; only the headline is readable.
- Capital Allocation Pro model portfolio changes effective on Monday's closing prices were posted at 12:56 EDT; the change detail sits behind an image link and was not extractable.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Alphabet (GOOGL)	349.39	▲ 3.22%	\$4.256tn	Best of the seven. 35.8m shares vs 26.4m average. Still a Hedgeye short — offside for a third consecutive session, and the position was made on signal, not narrative.
Meta (META)	665.60	▲ 2.71%	\$1.696tn	Range 649.22–668.60, closed in the top sixth. A Hedgeye long that finally paid after losing money on Thursday.
Microsoft (MSFT)	505.41	▲ 1.97%	\$3.753tn	Reclaimed 500 on 23.1m vs 19.1m average. The least chip-levered of the hyperscalers and it traded like it.
Apple (AAPL)	333.08	▲ 0.24%	\$4.861tn	Fourth straight gain, 39.2m shares on a 46.6m average — the quietest volume in the group. 3.3% off its 344.57 52-week high.
Amazon (AMZN)	253.54	▼ 1.26%	\$2.735tn	The only mega-cap platform to fall meaningfully without a chip exposure story. Closed 2.81 off the low.
Tesla (TSLA)	358.97	▼ 1.77%	\$1.418tn	Range 357.04–367.73, closed at the low end. 32.4m vs 43.6m average — sold without conviction. Musk's endorsement of the slowdown call did his own stock no favours.
Nvidia (NVDA)	210.96	▼ 3.36%	\$5.084tn	Roughly \$177bn of capitalisation gone on 131.8m vs 119.4m average, closing 2.03 off the low. Removed from Hedgeye's Signal Strength list the same morning. Still the largest company in the world.

Outside the seven but the same trade: Broadcom (AVGO) **−4.77%** to 344.72, \$1.646tn cap, 30.4% below its 495.00 52-week high.

Capitalisations are TradingView's market_cap_basic field captured in the same 06:07:41 window as the prices. Nvidia's dollar loss is derived from the captured capitalisation and the percentage change, so it is an approximation to the nearest billion, not an exchange figure.

6 Positioning & options

- **The single most actionable number in this brief: SPX closed 7,619.98 against a 7,656 gamma flip.** McCullough cited Tier 1 Alpha on air; below the flip, dealer hedging turns pro-cyclical and downside moves accelerate. The index closed 36.98 points — 0.48% — on the wrong side of it, two days before an FOMC and four days before quadruple witching.
- **VXN 22.05 versus a 22.14 breakout trigger.** Nasdaq implied vol traded 21.50–24.02 and closed 0.41% below the published level. VIX did the same thing at index level: high 18.17, close 17.11, back inside the risk range. Volatility was bought hard and sold back — which is what happens when a shock is judged sectoral rather than systemic.
- **Russell futures carried the heaviest relative volume of the session** — RTY 311,783 lots against a 190,638 average, +63% — on a −0.36% day. That is positioning, not price discovery, and it coincides with Hedgeye opening a fresh IWM short.
- **Semiconductor ETF volumes were roughly 60% above average and the after-hours tape bid them back.** SMH 10.6m vs 6.5m (+64%), SOXX 11.2m vs 7.5m (+51%). Both closed higher after hours — SMH +0.46%, SOXX +0.49% — as did NVDA (+0.61%), AMAT (+0.66%) and WDC (+0.72%). Someone was covering into the close.
- **The after-hours tape disagreed with the session in exactly one direction.** Of the nine worst semiconductor names, every single one closed higher post-market. Of the software winners, Adobe (−0.37%), Workday (−0.42%), Netflix (−0.38%) and Alphabet (−0.44%) all gave a little back. The overnight market faded Monday's rotation at the margin.
- **Energy hedging looks one-sided.** XLE traded 47.1m shares against a 30.7m average — **+54%** — to close down 0.94% on a day crude rose. OIH traded 363,609 against 279,193. That is heavy selling into a rising underlying, and it is the third session of the pattern.

7 Sector rotation — leaders & laggards

SECTOR	CLOSE	DAY	VOLUME VS 10D	NOTE
Communication Services (XLC)	115.07	▲ 2.19%	4.34m / 4.34m	Best sector. Alphabet, Meta and Netflix did the work. Closed 19c off the high.
Health Care (XLV)	167.75	▲ 1.45%	9.41m / 7.79m	+21% volume. Hedgeye's number three long finally worked. Lilly +2.02%, UNH +1.18%.
Consumer Staples (XLP)	84.42	▲ 1.25%	10.50m / 10.25m	Defensive bid on ordinary volume — the cleanest signal that this was rotation with a hedge, not rotation alone.

Consumer Discretionary (XLY)	112.85	▼ 0.10%	5.28m / 5.69m	Essentially unchanged, dragged by Tesla and Amazon against everything else higher.
Financials (XLF)	57.03	▼ 0.38%	38.14m / 31.19m	+22% volume on a small move. JPMorgan was removed from Hedgeye's Signal Strength list the same morning.
Real Estate (XLRE)	43.12	▼ 0.69%	6.18m / 5.62m	Rate-sensitive and behaving like it, on the day the 10-year touched 5%.
Materials (XLB)	50.49	▼ 0.90%	11.41m / 12.07m	Copper -2.19%, gold miners -3.05%. Below-average volume — nobody defended it.
Energy (XLE)	64.53	▼ 0.94%	47.11m / 30.65m	+54% volume. Opened 65.96, within 22c of the 66.17 52-week high, and closed 35c off the low. Third consecutive session of distribution on strength.
Utilities (XLU)	41.82	▼ 1.34%	23.58m / 22.98m	Low 41.75 against a 41.74 52-week low — within a penny. Hedgeye's biggest sector short, and McCullough said he would reload it on any bounce.
Industrials (XLI)	169.93	▼ 1.42%	7.36m / 7.49m	9.7% below its 188.19 52-week high. Also a Hedgeye short.
Technology (XLK)	184.28	▼ 1.81%	8.53m / 6.45m	Worst sector, +32% volume. The semiconductor damage diluted by the software rally inside one wrapper.
<i>Equal-weight S&P (RSP)</i>	215.01	▲ 0.07%	6.73m / 6.25m	<i>The control. Equal-weight rose while cap-weight fell — the average stock had a fine day.</i>

Leader-to-laggard spread **400 basis points** (XLC +2.19% to XLK -1.81%) on a session in which the S&P 500 moved 48 basis points. Three sectors up, eight down.

- **Leaders** — communication services, health care, staples. Two of the three are defensives and the third is the AI-adjacent trade that does not require a new chip order. That combination does not describe a growth scare; it describes a capex scare.
- **Laggards** — technology, industrials, utilities. Utilities and industrials are both rate stories, not AI stories; technology is entirely the semiconductor complex. XLK's 1.81% loss is a blend of SOX -5.86% and a software component that rose.
- **The rotation to watch today** is whether health care holds. Hedgeye has cut the XLV floor in three of the last four sessions to keep the long inside the band; Monday was the first session it earned its place. One good day after a month of excuses is not yet a trend.

8 Forward — futures & the week ahead

There is almost no overnight tape to report, and saying so honestly is more useful than pretending otherwise. Globex reopened at 18:00 ET — **06:00 GMT+8, eight minutes before the first capture** — and a second pull two minutes later returned byte-identical values for every futures contract on full prior-session volume. The feed had not rolled the session. Every futures row in this brief is therefore Monday's **settle**, roughly an hour old, not a live overnight print. The genuinely live markets at capture were spot gold, spot silver, spot copper, euro, yen, offshore renminbi, bitcoin and ether — and of those, only crypto had a session long enough for its change figure to mean anything.

What can be said about the setup: **bitcoin rose 2.46% to \$78,720 while AI equity risk was being cut**, which is the opposite of the correlation that has held for most of this year, and it takes bitcoin 4.96% clear of the \$75,000 level McCullough has named as his TRADE line. The after-hours US tape bid the semiconductors back — every one of the nine worst chip names closed higher post-market — and faded the software winners slightly. Neither is a large move; both point the same way, which is that Monday's rotation was at least partly a one-day event being partially unwound before Asia even opens.

DAY (GMT+8)	KEY EVENTS
Tue 15 Sep	Asian cash opens into an unpriced 5.86% semiconductor decline — Tokyo/Seoul 08:00-08:30, Hong Kong 09:30, India 12:15. FOMC meeting day one (Washington). US data slots for August retail sales and industrial production sit in this window on secondary calendars — <i>unconfirmed against the releasing agencies</i> . Fed communications blackout remains in force until the decision.
Wed 16 Sep	Asian and European sessions run into the decision. FOMC statement 14:00 ET ; press conference 14:30 ET. In GMT+8 that lands overnight — see Thursday.
Thu 17 Sep	02:00 GMT+8 — FOMC decision. First Warsh-chaired meeting at which a hike is the base case; prediction and futures markets price 25bp at 79-90% , which would be the first increase since 2023. Press conference 02:30. Asia trades the outcome from its own open six hours later. Bank of England and Bank of Japan decisions fall in this part of the week on secondary calendars; <i>times unconfirmed</i> .
Fri 18 Sep	Quadruple witching — third Friday of the quarter, two sessions after the Fed, with the S&P below its gamma flip line going in. Index and single-stock options and futures expire together; the largest positioning unwind of the quarter.
Ongoing	

Hedgeye's Tuesday Early Look publishes ~19:30 GMT+8 today and supersedes every risk range in section 4. The Macro Show runs immediately after.

FOMC dates and times are taken from the Federal Reserve's own published calendar. Quadruple witching is arithmetic — the third Friday of the quarter-end month. Retail sales, industrial production, BoE and BoJ timings come from secondary calendars and were not confirmed against the releasing institutions this morning; treat them as indicative.

9 Corporate news

- **The semiconductor damage was broad and led by equipment and memory, not by Nvidia.** Applied Materials **-7.07%**, Marvell **-7.32%**, Intel **-5.59%**, Micron **-5.25%**, SanDisk **-4.98%**, Broadcom **-4.77%**, Western Digital **-4.53%**, AMD **-4.40%**, Nvidia **-3.36%**. The names furthest up the capex chain fell hardest, which is the correct shape if the market is repricing the *rate of investment* rather than current demand.
- **Micron was named on air as the preferred semiconductor short.** Asked directly on The Macro Show for the best short in the group, the answer from the room was MU, tied to memory being fundamentally bearish. It closed 924.03, **-5.25%**, on 27.0m shares against a 25.7m average.
- **Adobe +5.30% to 265.60 — the single best large-cap move of the session**, and a stock that fell 6.03% on 10 September after guiding up. It remains **28.4% below** its 370.86 52-week high. Workday +4.58%, Netflix +3.77%, Palantir +3.64%; ServiceNow and Salesforce also reported higher. The common factor is that all of them have been sold this year on the argument that AI agents would displace them.
- **Oracle fell 3.65% to 144.79 and is now 56.1% below its 329.50 52-week high**, on 42.0m shares against a 35.9m average. The FQ1 beat of 10 September — adjusted EPS 1.92 against 1.74, revenue \$19.35bn, RPO \$664bn — has now been entirely given back and then some. Oracle is the purest listed expression of AI infrastructure financing, which is the exact thing Amodei's remarks called into question.
- **Oil services took the worst of the energy reversal.** OIH **-4.42%** to 402.06 on 363,609 shares against a 279,193 average, breaking \$12.94 below Hedgeye's published floor. XLE **-0.94%** on +54% volume. Neither is consistent with Brent trading above \$105.
- **Gold miners were cut both ways.** GDX fell 3.05% to 94.14 and was removed from ETF Pro Plus on the same day; Newmont was removed from Signal Strength Stocks. On 11 September McCullough had specifically noted that the miners carried stronger signal strength than gold itself. That view lasted one session.
- SoftBank fell 10.7% in Tokyo — some reports put the intraday decline at 13% — on Altman's IPO comment. Kioxia **-6.37%**; Samsung Electronics and SK Hynix both fell more than 3.5%.

10 Macro data

- **US August CPI, released Friday 11 September, is the number the whole week now runs on.** Headline **+0.4% m/m, in line**, taking the annual rate to **3.4% y/y, in line** with the Dow Jones consensus this brief carried into Friday. Core was the miss: **+0.3% m/m against +0.2% expected**, 0.1pp hot, with the core annual rate at 2.4%. **Gasoline rose 3.9% and accounted for more than a third of the headline gain.**
- **That composition is why the hike is priced.** A headline driven by petrol with a core that is simultaneously running hot removes the "look through the energy shock" argument. Prediction markets moved to 79.3% for 25bp; futures and Polymarket to 85-90%. Against the 62% level recorded on 10 September after PPI, the market has added roughly 20 percentage points of hike probability in two sessions.
- August PPI, released 10 September, sits underneath it: headline **+0.4% m/m in line** but **+5.4% y/y against 5.3% consensus**, while **core PPI was softer at +0.2% against +0.3% expected**. Final-demand goods +1.1% against services +0.1% — the same energy-only composition as CPI.
- Hedgeye's own inflation nowcast was running 3.7-3.8%, roughly 38bp above the Cleveland Fed, ahead of the CPI print. The 3.4% actual came in below that, which is the one data point of the last week that argues against the Hedgeye framing — and the Early Look did not address it.
- **No first-tier US macro release landed on Monday.** The session was driven entirely by a corporate-communications event and by the bond market's reaction to Friday's inflation data. That is worth stating plainly: a 5.86% sector move with no economic catalyst behind it is a positioning event.
- US diesel remains at a record \$5.94 per gallon and regular petrol at \$4.15 against \$2.98 before the war, per the figures this brief carried on 11 September. *Not re-verified this morning.* Eight weeks from the midterms, that is the political constraint on any fiscal response to a supply shock.

11 Geopolitics

- **◆ The Strait of Hormuz remains the marginal price-setter for global crude and the situation has escalated within the month.** US Central Command confirmed the destruction of five named Iranian tankers in the Gulf of Oman and near Kharg Island on 9 September, in response to attempted ballistic-missile attacks on a US Navy warship; Tehran responded by firing missiles at Jordan and warning shipping in the Gulf. Brent settled \$101.21 that day. The 60-day US-Iran ceasefire expired in mid-August and maritime traffic has not returned to pre-war levels. Roughly one-fifth of global oil supply transits the strait in peacetime.
- **▼ The oil market's own verdict on Monday was that the escalation premium is now largely in the price.** Brent traded \$109.78 and settled \$105.68 — a \$4.10 rejection — with WTI and RBOB showing the same shape.

Three consecutive sessions of energy equities falling on rising crude says the same thing from a different direction.

- **▲ The inflation channel is where this reaches everyone else.** Gasoline contributed more than a third of August's CPI gain; the 10-year touched 5%; a Fed hike is priced at 79-90%. A shipping-lane conflict is now, mechanically, the dominant input to US monetary policy — which is why McCullough's line on the tape was that the house is already hiking for the Fed.
- **◆ Attribution note:** the tanker-strike accounts above are attributed to US Central Command via Bloomberg, CBS and Al Jazeera reporting, and to Iranian statements. Casualty and vessel-ownership claims in this conflict have been contested by both sides throughout and none is stated here as settled fact.

12 Overnight setup — what Asia opens into

INSTRUMENT	LEVEL	CHANGE	VOLUME / 10D AVG	STATUS AT CAPTURE
ES — E-mini S&P	7,625.00	-0.45%	1,830,561 / 1,487,123	Monday settle
NQ — E-mini Nasdaq	29,152.25	-0.80%	497,204 / 513,719	Monday settle
YM — E-mini Dow	52,440	-0.28%	80,151 / 69,128	Monday settle
RTY — E-mini Russell	2,894.10	-0.36%	311,783 / 190,638	Monday settle
USD/JPY	154.331	noise	2,132 ticks / 359,156	LIVE, ~1h into session
USD/KRW	1,346.61	+0.38%	47,882 / 63,325	Monday Asian settle, ~15h old
USD/TWD	31.7797	+0.55%	20,182 / 34,271	Monday Asian settle, ~15h old
USD/CNH	6.7076	noise	1,511 ticks / 79,730	LIVE; 0.07% off a 52-week low
EUR/USD	1.1550	noise	1,333 ticks / 142,116	LIVE, ~1h into session
Gold — spot	4,298.20	flat	—	LIVE; futures settled -1.29%
Silver — spot	63.213	flat	—	LIVE; futures settled -1.61%
Copper — spot	6.2892	flat	—	LIVE; futures settled -2.19%
WTI — CL1	101.39	+1.34%	388,624 / 326,235	Monday settle; high was 104.95
Brent — BZ1	105.68	+1.02%	67,503 / 50,632	Monday settle; high was 109.78
Bitcoin	78,720	+2.46%	—	LIVE and genuinely 24h
Ether	2,547.14	+2.83%	—	LIVE and genuinely 24h

Previous Asian closes, Monday 14 September, for reference — these are yesterday's settles, not live: Nikkei 225 **63,492.77 (-0.81%)**, Hang Seng **24,917.61 (+0.45%)**, KOSPI **6,684.38 (-3.26%)**, Shanghai Composite **3,885.33 (-0.07%)**, ASX 200 **8,749.90 (+0.10%)**, Sensex **74,781.76 (-0.16%)**. European closes: DAX -0.50%, Euro Stoxx 50 -1.02%, CAC -0.76%, IBEX -1.38%, FTSE 100 **+0.44%** — the only major Western index that rose.

- **Korea has the largest gap to close and it is not a small one.** KOSPI fell 3.26% on Monday to 6,684.38 — its own session, before the US opened — as Samsung and SK Hynix each shed more than 3.5%. The Philadelphia SOX then fell a further **5.86%** after Korea had closed. McCullough put the KOSPI TRADE level at roughly 6,971, said it failed, and marked the index down about 27% from its June 2026 AI high. Seoul opens at 08:00 GMT+8 into a US semiconductor session it has not yet seen, with the won already 0.38% weaker.
- **The US tape hands Asia a sector, not a direction.** The instruction is specific: sell what builds models, buy what uses them. Taiwan opens at 09:00 with TSMC as the single largest weight in its index and the identical question. Japan has SoftBank already down 10.7% and Kioxia 6.37%, so part of Tokyo's repricing is done; Nikkei futures are unavailable in this capture, so no view is offered on the gap.
- **Hong Kong is the one index that rose on Monday** — +0.45% to 24,917.61 — and it has the least semiconductor weight of the group, with an offshore renminbi within 0.07% of a 52-week high in currency terms. That combination argues Hong Kong is the least exposed to the overnight handover.
- **The single instrument most likely to move: the KOSPI, and inside it the memory complex.** Hedgeye is explicitly bearish TRADE and TREND on both DRAM and KOSPI, the index has already broken its own trade level, and it opens into an unpriced 5.86% move in the sector that dominates it. The second candidate is oil services across Asian energy names — OIH broke a published floor on rising crude, which is the kind of divergence that transmits.

13 AI watch

- **Three of the most consequential people in the industry argued publicly for slowing it down, and the market repriced immediately.** Anthropic's Dario Amodei warned that within six to twelve months AI agents "could be capable of taking over the entire internet potentially causing hundreds of billions of dollars in damage" and called on companies to slow the rate at which they advance model capabilities. Sam Altman and Elon Musk both said they agreed. This is the first time the frontier labs have collectively made a safety argument with a direct, measurable equity consequence.

- **Sam Altman withdrew the OpenAI listing for the year** — "Given everything happening with safety, right now would be an ill-advised moment to go public." SoftBank, the most levered listed proxy for that outcome, fell 10.7% in Tokyo. The IPO was the exit that a large amount of private AI capital had been underwriting.
- **The market's interpretation was precise and worth respecting.** It sold the capital-goods layer — equipment (AMAT -7.07%), memory (MU -5.25%, SNDK -4.98%, WDC -4.53%), networking silicon (MRVL -7.32%, AVGO -4.77%) — and bought the application layer. It did not sell the hyperscalers: Microsoft +1.97%, Alphabet +3.22%, Meta +2.71%. If frontier capability plateaus, the people who own distribution keep their margins and the people who sell the shovels lose their growth rate. That is a defensible reading, not a panic.
- **Hedgeye's Early Look was written on the same theme before the session and reached the opposite conclusion about causality.** McCullough's argument is that the AI bubble is a financing bubble, not a technology bubble — "The idea was never the bubble. The bubble is always the financing of the idea" — and that the binding constraint is the cost of capital, with the 10-year at 5%, rather than anything Amodei says. On a day when both stories were live, that distinction is testable: if the semiconductor decline persists while yields fall, it was the safety story; if it persists only while yields rise, it was the financing story.
- **Nvidia remains the largest company in the world at \$5.084tn after losing roughly \$177bn.** It was removed from Hedgeye's Signal Strength Stocks list on the same morning, alongside Marvell. That list is now 46 names, down from 61 six sessions ago.

14 Beyond the markets

- **The equal-weight S&P rose.** RSP +0.07% while the cap-weight index fell 0.48%. Every headline this morning will describe a down day. For the median US listed company it was not one — and that gap between the index and the average stock is now the defining feature of this market.
- **The 30-year fell while everything shorter rose.** That is the bond market saying it does not believe an inflation shock driven by a shipping lane is a permanent change to the price level — it believes it is something the Fed will have to over-tighten into and then reverse. The flattest curve of the cycle is a forecast of a policy mistake, not of inflation.
- **Three credit instruments printed 52-week lows on the same day and all three closed higher off them on above-average volume.** HYG, LQD and TLT. Nobody will lead with that, and it is the most concrete evidence in the session that there is a bid underneath the rate move.
- **The Fed's first hike since 2023 is being priced at 79-90% and almost nothing in equity volatility reflects it.** VIX closed at 17.11 — below its own 52-week midpoint, inside its risk range, and 51% off the 35.30 high. A first hike in three years, under a new chair, two days before quadruple witching, with the index below its gamma flip, is not a 17 VIX event on any historical comparison.
- **Bitcoin rose while AI equity risk was cut.** \$78,720, +2.46%, and Hedgeye's daily ETF re-rank had IBIT as its second-largest mover. For most of this cycle bitcoin has traded as a high-beta expression of exactly the risk that was being sold. Monday it did not. One session is not a regime change, but it is the first observation.

15 Appendix — stock cards

NVDA · NVIDIA**210.96 ▼ 3.36%**

Cap \$5.084tn · 131.8m sh vs 119.4m avg · 52wk 164.27-236.54 · next: FOMC 17 Sep 02:00 HKT

Lost roughly \$177bn and remains the largest company in the world. Removed from Hedgeye's Signal Strength Stocks the same morning. Closed 2.03 off the low and traded 0.61% higher after hours — the selling was not disorderly.

AMAT · APPLIED MATERIALS**424.21 ▼ 7.07%**

Cap \$337bn · 8.05m sh vs 5.93m avg (+36%) · 52wk 171.58-739.67 · next: FOMC

Worst large-cap in the session. Now **42.6% below** its 52-week high — the furthest drawdown of any major semiconductor name. Equipment is the first line item cut when the capex rate of change slows, and the tape priced that first.

MU · MICRON**924.03 ▼ 5.25%**

Cap \$1.044tn · 27.0m sh vs 25.7m avg · 52wk 154.65-1,255.00 · next: FOMC

Named on The Macro Show as the room's preferred semiconductor short, tied to memory turning fundamentally bearish. 26.4% off the high. Korea's memory complex opens into this at 08:00 GMT+8 having only partly repriced.

MRVL · MARVELL**218.82 ▼ 7.32%**

Cap n/a · 22.1m sh vs 19.8m avg · 52wk 67.36-329.88 · next: FOMC

Largest single-name decline in the group and removed from Signal Strength Stocks the same day. 33.7% below its high. Some wire copy put the move at "about 6%" — the captured close is -7.32%; treat the wire figure as a rounding of an intraday quote.

GOOGL · ALPHABET**349.39 ▲ 3.22%**

Cap \$4.256tn · 35.8m sh vs 26.4m avg (+36%) · 52wk 235.84-408.61 · next: FOMC

Best Mag7 performer and a **Hedgeye short** — offside for a third session. Owns distribution and its own silicon, so a frontier slowdown costs it least. Gave back 0.44% after hours.

ADBE · ADOBE**265.60 ▲ 5.30%**

Cap \$106bn · 5.72m sh vs 6.03m avg · 52wk 190.12-370.86 · next: FOMC

Best large-cap move of the session, on **below-average volume** — a short cover as much as a buy. Still 28.4% below its high after the 6.03% fall on 10 September despite raising guidance. The purest listed bet that slower agents buy incumbent software time.

ORCL · ORACLE**144.79 ▼ 3.65%**

Cap \$417bn · 42.0m sh vs 35.9m avg (+17%) · 52wk 114.50-329.50 · next: FOMC

56.1% below its 52-week high — the deepest drawdown of any US mega-cap. The FQ1 beat of 10 September (EPS 1.92 vs 1.74, RPO \$664bn) has been fully given back. Oracle is the listed proxy for AI infrastructure financing, which is precisely what was questioned.

OIH · OIL SERVICES ETF**402.06 ▼ 4.42%**

364k sh vs 279k avg (+30%) · 52wk 242.24-459.28 · Hedgeye band 415-438 bullish · next: FOMC

Broke \$12.94 below a published bullish floor on a day crude settled higher. Hedgeye is long this and ranks energy its number one sector. When a long breaks its own floor against a rising underlying, the position is the problem, not the commodity.

XLE · ENERGY SELECT SPDR**64.53 ▼ 0.94%**

47.1m sh vs 30.7m avg (+54%) · 52wk 42.35-66.17 · opened 65.96 · next: FOMC

Third consecutive session of distribution on strength: opened within 22c of the 52-week high, closed 35c off the low, on half again the normal volume. Two of those three sessions had crude up more than 1%.

TLT · 20+ YEAR TREASURY**80.93 ▲ 0.07%**33.7m sh vs 30.2m avg · 52wk low 80.46 = **today's low exactly** · next: FOMC 17 Sep 02:00 HKT

Printed a fresh 52-week low and closed green. A Hedgeye short that McCullough has already cut to minimum size on an overbought yield signal. If the Fed hikes and the long end rallies — his own stated scenario — this is where it shows first.

16 About this edition

- **Covers** — the US cash session of Monday 14 September as settled, the after-hours tape, the Globex reopen to the moment of capture, the full Hedgeye evening publication set, and overnight FX, crypto, commodities and rates.
- **Captured** — 06:07:41-06:09:51 GMT+8, a **2-minute 10-second window** across two pulls of the same 96-instrument request, comfortably inside the 10-minute standard. TradingView primary. Divergences and single-sourcing are documented in full in section 18.
- **Unusual about this run** — Globex reopened at 06:00 GMT+8, **eight minutes before capture**, and the second pull returned byte-identical values for all eleven futures contracts on full prior-session volume. The feed had not rolled the session, so every futures row is a Monday settle rather than a live overnight print. This is stated at each table rather than assumed away. Yahoo returned 0 of 62 symbols and circuit-broke on HTTP 429s for the tenth consecutive run; the machine reconciliation is therefore empty and was replaced by hand.
- **Settled vs live** — **settled:** all US cash equities (16:00 ET, 2h 08m old), all index and commodity futures (17:00 ET, 1h 08m), all Treasury cash yields, VIX, MOVE, DXY, USD/KRW, USD/TWD, and every Asian and European index. **Live:** spot gold, spot silver, spot copper, EUR/USD, USD/JPY, USD/CNH, bitcoin, ether. Of the live rows only crypto has a long enough session for its change figure to carry information; the FX and spot-metal rows are roughly one

hour into a new session on tick counts one to two orders of magnitude below average, and their change figures are labelled as noise rather than presented as moves.

- **Hedgeye edition** — FULL, logged in, no login attempted. The live risk-range set is the **Monday 14 September Early Look, "#MOAB In AI vs. The Cycle", by Keith McCullough**, published 07:31 EDT = 19:31 GMT+8. Today's Tuesday Early Look, due ~19:30 GMT+8, supersedes it. Also read in full: The Macro Show summary notes and replay (11:02 EDT), ETF Pro Plus update (10:16 EDT), Signal Strength Stocks (11:17 EDT), Capital Allocation Pro model portfolio changes (12:56 EDT) and the Macro Week Summary Notes index (11 Sep 16:29 EDT). Band moves were diffed against the stored 11 September set.
- **Quad path — not observed, and nothing is asserted.** The US Monthly Quad Forecast sits on page 2 of a PDF behind a secondary link from the Macro Week Summary Notes; it returns no extractable text. Sixth consecutive edition. The written Quad reads carried forward are US monthly Quad 2, US quarterly Quad 4 (dashboard dated 4 September, now eleven days old), global Quad 3. **Absence of a printed path is not evidence the path is unchanged.**
- **Not available** — the forward Quad path; the Portfolio Solutions ETF re-rank detail and the Monthly Inflation Nowcast, both outside this account's subscription tier; IGV and OIH prices from the standard capture universe, for a seventh consecutive edition (OIH was fetched separately this morning, IGV could not be resolved on any exchange prefix); and the MOMO Tracker, Crypto Quant, KM's Top 3 and Chart of the Day, none of which appeared in the feed since the previous edition.

17 Sources

Prices. TradingView bulk scanner, two pulls at 06:07:41 and 06:09:49 GMT+8, 96 instruments each, plus a targeted second request for OIH, ADBE, XLE, GDX, MRVL, VXN and others outside the standard universe. Yahoo Finance was attempted as the independent second source and returned nothing.

Hedgeye. app.hedgeye.com, authenticated session: Early Look 14 Sep 07:31 EDT; The Macro Show summary notes and replay 14 Sep 11:02 EDT; ETF Pro Plus update 14 Sep 10:16 EDT; Signal Strength Stocks 14 Sep 11:17 EDT; Capital Allocation Pro 14 Sep 12:56 EDT; Macro Week Summary Notes 11 Sep 16:29 EDT. Prior risk ranges from this brief's own stored 11 September set.

Macro and policy. August CPI and PPI detail via CNBC, Kiplinger, TD Economics and Babypips reporting of the BLS releases; FOMC dates from the Federal Reserve's published 2026 calendar; hike probabilities from Polymarket, Federal News Network and DeFiRate prediction-market aggregation.

Session narrative and single stocks. Associated Press "How major US stock indexes fared Monday 9/14/2026" via WTOP and WUSA9; Bloomberg, CNBC, TheStreet, Yahoo Finance, NBC News, CNN Business, Charles Schwab, The Motley Fool, AdvisorHub and 24/7 Wall St for Monday's session; TradingKey and Seoul Economic Daily for the Asian tape.

Commodities, geopolitics and AI. Bloomberg and CBS News on the 9 September US strikes on Iranian tankers; Al Jazeera and Energy Connects on the Hormuz supply picture and Brent; CNN Business, NBC News and The Business Standard on the Amodeli-Altmann-Musk slowdown statements and the OpenAI listing decision.

18 Data-confidence

CROSS-CHECKS PASSED

- **Cash index arithmetic is self-consistent to five decimal places on every row.** Working it explicitly: SPX close 7,619.98 less change -37.00 implies a prior close of 7,656.98, and $37.00/7,656.98 = 0.4832\%$, against a reported 0.4832% — delta 0.00000. The same test passes on COMPQ (implied prior 26,333.0353, -0.5568% both ways), DJI (52,573.29, -0.2893%), RUT (2,903.9443, -0.4032%), SOX (11,823.9981, -5.8585%) and VIX (15.85, +7.9495%).
- **All four implied prior closes match the previous edition's recorded settles exactly** — SPX 7,656.98, COMPQ 26,333.04, RUT 2,903.94, VIX 15.85. This is a genuine independent check: those figures were captured 24 hours ago from a separate request and stored, and today's capture reproduces them from a different field. Continuity of the series is confirmed.
- **Manual wire cross-check recovers the second source Yahoo could not provide.** The Associated Press "How major US stock indexes fared Monday" wire gives Dow -0.29%, S&P 500 -0.48%, Nasdaq -0.56%; the capture gives -0.2893%, -0.4832%, -0.5568%. All three match to the reported precision. Bloomberg's "semiconductor gauge down by 5.9%" matches the captured SOX -5.86%; "Nasdaq 100 fell 0.8%" matches QQQ -0.80%; "Nvidia fell 3%" matches NVDA -3.36%. TheStreet's "10-year Treasury yield hits highest since 2023" matches the captured 5.012% intraday high being the 52-week high exactly. KOSPI 6,684.37 (TradingKey) against 6,684.38 captured. That is eight independently-sourced rows validated.
- **Futures-to-cash basis is normal on all three comparable pairs**, which confirms the futures rows are settles and not mislabelled live prints: ES +5.02 (+0.066%), YM +18.80 (+0.036%), RTY +1.86 (+0.064%). A dislocated basis would have exposed a stale or wrongly-timestamped row; none was found.
- **The two-pull divergence pattern is itself a validity test and it passed cleanly.** Eleven futures contracts, DXY, USD/KRW, USD/TWD, four Treasury tenors and VIX returned *identical* values across pulls two minutes apart — correct behaviour for closed markets. Spot gold, spot silver, spot copper, EUR/USD, USD/JPY, USD/CNH, bitcoin and ether all moved — correct behaviour for open markets. No instrument sat in the wrong category.
- **Spot-versus-futures bases are internally coherent** at gold 1.25%, silver 1.46% and copper 1.83% — all positive, all in a plausible contango band for the tenor, none anomalous. This matters because two risk-range rows would misread badly on the wrong series: measured on HG1 futures, copper would show 29.4% of band instead of the true **8.8%**.

KNOWN CONFLICTS AND WEAK MARKS

- **Marvell's decline is reported two ways.** CNN Business reported Arm and Marvell "slid 6%"; the capture gives MRVL −7.32% at the close, from 218.82 against an implied prior of 236.10. The brief uses the captured close because the wire figure almost certainly describes an intraday quote taken before the final hour. The *direction and magnitude class* are robust; the decimal is the capture's, single-sourced.
- **SOXX is reported at −5% by Bloomberg and −5.63% by the capture** — a 63bp gap on the same instrument. Both agree SOX itself fell about 5.9%. The brief uses the captured figures throughout and does not attempt to reconcile the ETF discrepancy, which is most likely a rounding of an intraday level.
- **Nvidia's "\$177bn of capitalisation" is derived, not observed.** It is computed from the captured market_cap_basic of \$5.084tn and the −3.36% change. That method assumes the capitalisation field is struck at the same close as the price, which is standard but not verified. Treat it as accurate to roughly ±\$5bn, not to the billion.
- **Every "fresh 52-week low/high" claim rests on a single field from a single source.** The 52-week extremes for UST 2Y (4.679), UST 10Y (5.012), HYG (78.41), LQD (104.05) and TLT (80.46) each equal the captured intraday extreme to the last decimal — which is exactly what a genuine new extreme looks like, and also exactly what a same-source artefact would look like. The conclusions drawn from them are robust; the decimals are not independently confirmed.
- **OIH's price was fetched outside the standard capture window**, in a separate request at roughly 06:12 GMT+8, and is a Monday settle. The 402.06 level and the resulting 3.1% breach of Hedgeye's 415 floor are solid; the exact minute of capture differs from the rest of the table by four minutes, which is immaterial for a closed market but is disclosed for completeness. **IGV could not be resolved at all** on any exchange prefix, so that risk-range row carries no position and the software call is evidenced by constituent moves instead.
- **Hedgeye's own inflation nowcast of 3.7-3.8% overshot the 3.4% CPI actual by 30-40bp**, and the 14 September Early Look does not address the miss. The brief reports both figures rather than choosing between them. The nowcast level itself is carried from the 11 September edition and was not re-verified this morning.
- **US diesel and petrol price levels (\$5.94 and \$4.15 per gallon) are carried forward from 11 September and were not re-verified.** They are used only as context for the political constraint, not as a data point in any conclusion.

KNOWN GAPS

- **No machine second source ran.** Yahoo returned 0 of 62 symbols and hit its 5-consecutive-429 circuit breaker in 2.1 seconds — the tenth consecutive failure, consistent with IP-level throttling rather than an outage. The script's reconciliation therefore printed **0 match · 0 minor · 0 DIVERGENT · 57 single-sourced. There are no divergent rows to resolve because no second machine source ran** — that is not a clean reconciliation and must not be read as one. The manual wire cross-check above recovers eight rows of genuine independent validation; the remaining forty-nine are TradingView-single-sourced.
- **The forward Quad path was not read for a sixth consecutive edition.** It sits on page 2 of the US Monthly Quad Forecast PDF inside the Macro Week Summary Notes; the PDF exposes no accessibility text and the viewer ignores synthetic navigation. **Absence of a printed path is not evidence the path is unchanged.** The US quarterly Quad reading carried in section 4 is dated 4 September and is now eleven days old, in open tension with the monthly read.
- **The MOMO Tracker, Crypto Quant, KM's Top 3 / From The Desk and Chart of the Day did not appear in the feed since the previous edition.** These are precisely the publications through which an intraday position change is disclosed. **Absence of a Hedgeye position change in this brief is not evidence that none occurred.** What was captured — eight ETF Pro Plus changes and fifteen Signal Strength additions and removals — is what was published in readable form.
- **Portfolio Solutions daily ETF re-rank and the Monthly Inflation Nowcast return ACCESS DENIED** on this account, which holds Bitcoin Trend Tracker, Capital Allocation Pro, Digital Assets Pro, Early Look, ETF Pro Plus, Momentum Stock Tracker, Signal Strength Stocks and The Macro Show. This is a subscription boundary, not a fault. The re-rank's top movers (COLO +13, IBIT +10, FXC +8) are readable from the feed headline only. Capital Allocation Pro's model portfolio change detail sits behind an image link and was not extracted.
- **Intra-week US data timings are from secondary calendars and unconfirmed.** August retail sales, industrial production and the Bank of England and Bank of Japan decisions are marked indicative in section 8. The FOMC dates and the quadruple-witching date are confirmed — the former from the Federal Reserve's own calendar, the latter by arithmetic.
- **No Asian or European cash market was open at capture**, so section 12 is a setup and not a report. The previous Asian and European closes quoted there are Monday settles, labelled as such, and are between 12 and 16 hours old.

TIMING & UNVERIFIED

- **Capture window 06:07:41-06:09:51 GMT+8**, two pulls, 2 minutes 10 seconds total spread. The run fired on schedule at 06:07 with no material offset.
- **Age of the stalest rows, in hours.** US cash equities **2h 08m**. Index, energy and metals futures, Treasury yields, VIX, MOVE and DXY **1h 08m**. USD/KRW and USD/TWD **~15h** (Monday Asian close). Asian cash indices **12-16h**. European cash indices **~10h**. The Hedgeye risk ranges were published **10h 36m** before capture. The Quad quarterly reading is **eleven days** old.

- **What has moved since, and what will move next.** Globex has been open throughout the assembly of this brief and every futures level above is superseded by the time you read it. Asian cash opens from 08:00 GMT+8 into an unpriced 5.86% US semiconductor decline. Today's Hedgeye Early Look, due ~19:30 GMT+8, replaces the entire risk-range table in section 4, and The Macro Show follows it.
- **The single largest event risk in the window is the FOMC decision at 02:00 GMT+8 on Thursday 17 September,** with a 25bp hike priced at 79-90%. Everything in sections 1 through 12 is pre-positioning for that, and a surprise in either direction invalidates the levels rather than adjusting them.
- **Verify live prices before acting on anything in this document.** The futures rows in particular are settles that were an hour old at capture and are several hours old now; they are labelled as settles throughout precisely so that they are not mistaken for the overnight tape. This brief is information only and is not investment advice.
