

THE EQUITY EXPRESSION OF THE URANIUM THESIS

The Mill, Not The Mine

Three of the largest uranium producers reported inside the past three weeks, and the numbers do not describe a shortage of rock. Kazatomprom lifted first-half output 9 per cent; Paladin beat the top of its full-year guidance; NexGen holds a construction licence for a deposit that could eventually produce more pounds a year than the entire deficit the bulls describe. Yet the long-term contract price sits above spot, at levels last seen more than eighteen years ago, and the equities trade as though the pound were desperately scarce.

The reconciliation is that the binding constraint has moved. It is no longer in the orebody but in the two industrial steps between a pound of yellowcake and a fuel assembly a reactor can burn.

A reframe worth holding onto

The internal Wiki's central reframe, drawn from 13D Research, is that uranium has stopped being a mining story and become a fuel-cycle story. In its 23 July note 13D describes conversion — not mining — as the tightest bottleneck in the chain, with only three Western providers, and identifies enrichment as the second chokepoint with a single American-owned operator.

On that reading, the pounds are the least interesting part of the trade. This is a view held by one research provider, not a verified fact, and it is the lens this edition tests against what the companies actually reported.

Method. External figures were verified against company releases, exchange announcements and the World Nuclear Association between 5 and 11 August 2026, and each carries an as-of date. Internal figures come from the Heyokha research Wiki, are attributed to the named provider and are labelled as views, not forecasts. Conversion and enrichment price indicators are published only to UxC and TradeTech subscribers; those levels are reported as internal characterisations or omitted. Live equity quotes could not be verified, so the company cards carry dated reported figures, not prices.

Consider a district with one bakery and a wheat harvest 9 per cent larger than last year. The baker is not reassured. Flour, not wheat, goes into the oven, and the district has three mills — one owned by a neighbour the baker must stop trading with by a fixed date. The baker will pay almost anything for flour, because flour is about a twentieth of what a loaf costs and an idle oven costs everything. So the queue lengthens even in a bumper year, and what reprices is not wheat but a guaranteed delivery slot at a mill that is not the neighbour's. Uranium is the wheat. Conversion and enrichment are the mills. Reactors are ovens that take four years to build and cannot switch grain.

THE STORY IN 60 SECONDS

+9%

Kazakh first-half output rose to 13,291 tonnes from 12,242, and guidance of 27,500–29,000 tonnes was reiterated. The largest producer is adding volume. *Kazatomprom, 3 Aug 2026.*

\$95.50

Long-term price per pound at 31 July 2026, against spot of \$86.38. Term above spot is unusual, and term is where most volume trades. *Cameco indicators, 31 July 2026.*

–\$10m

Westinghouse's Q2 result attributable to Cameco, against \$126m a year earlier; adjusted EBITDA fell to \$163m from \$352m. *Cameco Q2 report, 31 July 2026.*

WHAT ACTUALLY HAPPENED

A reporting season that split the thesis in two

Cameco reported its second quarter on 31 July. Net earnings were \$25m, adjusted net earnings \$77m and adjusted EBITDA \$391m; for the first half, adjusted EBITDA reached \$899m. Production attributable to Cameco was 3.9 million pounds in the quarter against sales of 7.1 million pounds, so the company sold nearly twice what it dug. Spring road conditions and May flooding in Saskatchewan — a collapsed bridge suspended Key Lake and curtailed McArthur River for roughly two weeks — pulled first-half Canadian output to 10.1 million pounds, 5 per cent below the prior year. Further operational difficulty at Cigar Lake emerged after the quarter closed. Full-year guidance of 19.5 to 21.5 million pounds was nonetheless left unchanged.

The detail that deserves more attention than it received is the inventory line. Cameco held 8.7 million pounds at 30 June at an average cost of \$58.05 a pound, against a spot price near \$86. That is a large unrealised gain sitting in working capital, and it is also a reminder that a miner's economics are set by the contracts it signed years ago, not by the screen. The same pattern appears everywhere in the sector this reporting season. Kazatomprom realised \$70.79 a pound across the group in the second quarter — a 17 per cent improvement year on year, and still roughly \$16 below spot. Paladin realised \$70.6 a pound in its fourth quarter against a unit production cost of \$51.6. Three companies, three healthy margins, and not one of them earning the headline price.

Centrus Energy, reporting on 5 August, told the other half of the story. Revenue rose 14 per cent to \$176.1m, with enrichment up 22 per cent to \$153.4m. Separative work volumes fell 23 per cent while average pricing rose 3 per cent — a business selling less and earning more, which is what a genuine bottleneck looks like in a profit-and-loss account. Backlog reached \$4.5bn through 2040, including roughly \$3.7bn of enrichment commitments, and a \$900m Department of Energy award for high-assay fuel was signed during the quarter. Cash stood at \$1.87bn.

Kazatomprom's update on 3 August is the awkward one for the deficit narrative. First-half production rose 9 per cent on a 100 per cent basis and 10 per cent attributable, and 2026 guidance of 27,500 to 29,000 tonnes was reiterated. Its own commentary notes spot rising 25 per cent through the half to average \$86.83 a pound against \$69.38, with transaction volumes 19 per cent higher — driven substantially by the Sprott physical trust, which held 81,697,348 pounds at 7 August. A producer that cut 2026 guidance by roughly 10 per cent last August, explicitly because it did not judge uncovered demand sufficient to justify full capacity, is now growing volumes into a rising market. Financial results follow on 21 August.

THE ESSENTIAL DISTINCTION

The price of uranium is not the price of nuclear fuel. On the World Nuclear Association's estimate, enrichment alone accounts for almost half the cost of a fuel assembly, and the whole assembly is about 5 per cent of the cost of the electricity. Buying pounds and buying the fuel cycle are two different trades, with two different bottlenecks — and, this year, two visibly different sets of results. *A pound of yellowcake cannot be loaded into anything.*

MECHANISM

Following one reactor's annual appetite through the chain

Reactor counts, capacity and uranium requirements: World Nuclear Association reactor table, updated 5 August 2026. SWU per reactor-year, world enrichment capacity and the cost-share estimates: World Nuclear Association, enrichment capacity figures on a 2022 basis. The count of three Western converters is 13D Research's characterisation (23 July 2026) and was not independently verified. Conversion and SWU price levels are published to subscribers only and are not reproduced here.

Enrichment capacity shares: World Nuclear Association, 2022 basis. Spot price and percentage changes: Trading Economics, 7 August 2026. Fuel cost composition: World Nuclear Association.

THE CENTRAL COMPARISON

Where the fuel cycle is actually concentrated

World enrichment capacity by operator, World Nuclear Association, 2022 basis; total roughly 61,500 thousand SWU a year. Bars are scaled to the largest holder and are illustrative of relative share, not drawn to an absolute axis. Two operators representing 58 per cent of capacity are headquartered in states subject to Western restriction or strategic competition.

That single chart carries most of the argument. Uranium mining is fragmented across Kazakhstan, Canada, Namibia, Australia and Niger, and it has just shown — in Kazakhstan's 9 per cent and Paladin's guidance beat — that it can add volume within a year when prices justify it. Enrichment cannot. A centrifuge cascade is a decade-long capital programme under nuclear licensing, and two-fifths of world capacity sits in a state whose material Western utilities must stop importing. The mine responds to price; the mill responds to permits.

A USEFUL MENTAL MODEL

Treat the reactor operator as a hostage facing a small ransom. Fuel is about 5 per cent of the cost of the electricity, so the price demanded barely matters; an unfuelled reactor is a catastrophe, so availability matters absolutely. Demand of that shape is inelastic in price and brittle in quantity. Markets like that do not clear gradually as textbooks suggest. *They sit still for years, then reprice in a step, when somebody discovers they cannot get a delivery slot.*

WHAT HAS ACTUALLY SHIFTED

Five changes, each cutting both ways

WHAT HAS CHANGED	WHAT IT LOOKS LIKE IN THE DATA	WHY IT CUTS BOTH WAYS
Term price has overtaken spot	Long-term indicator \$95.50/lb against spot \$86.38/lb at 31 July 2026; TradeTech put the term price at \$97.00/lb on 30 June, the highest in more than eighteen years.	Utilities paying a premium for future delivery is the clearest sign of scarcity anxiety. It is also the configuration that most reliably pulls forward new supply, and it means the marginal buyer has already conceded the tightness.
Kazakh volumes are rising again	First-half output 13,291 tU on a 100 per cent basis, up 9 per cent; 2026 guidance of 27,500–29,000 tU reiterated on 3 August 2026, a year after an approximately 10 per cent cut.	Rising output from the low-cost producer confirms demand is strong enough to reward volume. It also removes the supply-discipline argument that underpinned much of the 2024–25 bull case.
A very large new mine is now licensed	NexGen received a licence to prepare site and construct for Rook I from the Canadian regulator on 6 March 2026: up to 14 million kg U ₃ O ₈ a year, roughly 31 million pounds, over a 24-year life; construction from summer 2026, about four years to build.	Nothing arrives before roughly 2030, so the near-term gap is untouched. But a single project of that scale is comparable to the whole annual deficit the internal view describes, which gives the shortage a visible terminus rather than an open-ended one.
The enricher's economics have inverted	Centrus sold 23 per cent fewer separative work units in the second quarter at 3 per cent higher average pricing, with enrichment revenue up 22 per cent and backlog of \$4.5bn through 2040.	Selling less for more is the signature of a constrained supplier with pricing power. It is also a warning that volumes are being rationed, and rationed volumes eventually invite substitution or new entrants.
The reactor-services leg has weakened	Westinghouse's second-quarter result attributable to Cameco was a \$10m loss against \$126m of earnings a year earlier, with adjusted EBITDA of \$163m against \$352m; the first-half loss was \$56m against \$64m of earnings.	If the renaissance is real, the company that builds and services reactors should be its most direct beneficiary. That it is not, this year, suggests either lumpy project accounting or that the reactor build is slower than the fuel market implies.

Bull and bear, stated fairly

The case for

- **The chokepoint is genuinely narrow and genuinely political.** Rosatom holds 44 per cent of world enrichment capacity on WNA's 2022 figures, and Western utilities face a legislated end to Russian imports. Capacity of that kind cannot be replaced by a price signal alone.
- **Term pricing has confirmed it in cash.** The long-term indicator reached \$97.00/lb on 30 June 2026, its highest in more than eighteen years, and stood at \$95.50/lb on 31 July — above spot. Utilities are paying up for certainty of delivery.
- **Demand is close to price-insensitive.** Fuel is about 5 per cent of the cost of nuclear electricity on WNA's estimate, so a doubling of the uranium price barely touches a utility's economics while an interrupted delivery is intolerable.
- **The enricher's numbers already show it.** Centrus grew enrichment revenue 22 per cent on 23 per cent lower volumes in the second quarter, holds \$4.5bn of backlog through 2040 and \$1.87bn of cash, and signed a \$900m federal award for high-assay fuel.
- **The installed base keeps growing.** 79 reactors are under construction and 123 planned against 441 operable, on WNA's 5 August 2026 table — a build pipeline of roughly 198 GWe against 404 GWe in service.
- **Internal view.** 13D Research described uranium fundamentals as the strongest in decades on 23 July 2026, citing contract ceilings above \$150/lb and effective midpoints near \$120/lb, and targets \$125/lb or better before the deficit resolves. Presented as that firm's view, not as fact.

The case against

- **Supply has already responded.** Kazakh first-half output rose 9 per cent and Paladin exceeded the top of its full-year guidance at 4.82 million pounds. The proposition that mines cannot answer a price signal has been tested this year and has not held.
- **Spot has stopped moving.** \$86.50/lb on 7 August 2026 is 1.11 per cent above a month earlier, and the first-half average was \$86.83. Twenty per cent over a year is a real move; four weeks of nothing, at the peak of the narrative, is a fact the bull case must explain.
- **Producers are not earning the headline price.** Kazatomprom realised \$70.79/lb in the second quarter, Paladin \$70.6/lb; Cameco's inventory cost is \$58.05/lb. Legacy contracts mean a rising screen price reaches the income statement slowly, and cuts both ways when it falls.
- **Rook I gives the deficit an end date.** A licensed project of up to roughly 31 million pounds a year, comparable in size to the entire annual gap the bull case describes, changes what a buyer should pay for pounds deliverable in the 2030s.
- **The purest bottleneck play still depends on Russia.** Centrus's own 2026 guidance assumes no significant change in its ability to receive and sell Russian enriched uranium — the de-Russification thesis, underwritten by Russian material.
- **Valuation leaves little room.** Cameco was flagged in early February 2026 as trading near 142 times earnings against an industry average close to 16, and around a third above one estimate of fair value. Even a correct thesis can be fully priced.

The internal and external readings collide most directly on supply elasticity, and the collision is not resolved by anything available today. The Wiki's position, drawn from 13D's April and July notes, is that no major new mine arrives for at least three years, that new projects starting inside that window add only 20 to 22 million pounds a year against a 30 to 50 million pound annual deficit, and that the gap can therefore only be closed by a materially higher price. The external record of the past three weeks says something different in tone if not in arithmetic: the largest producer raised first-half volumes 9 per cent and reaffirmed guidance, the third-largest beat its own guidance, and the regulator licensed a mine whose eventual annual output is on the order of the whole deficit. Both accounts can be true — Rook I is a 2030 event, and 9 per cent of Kazakh output is a few million pounds against a nine-figure market — but they imply different prices for the same pound, and the flat spot market of the past four weeks has not adjudicated between them. A second tension sits alongside it: the internal view names Centrus as the clean expression of Western enrichment independence, while Centrus's own guidance rests on continued access to Russian material. Both are left open.

WHAT TO WATCH FROM HERE

The dashboard

SIGNAL	PLAIN-ENGLISH READING	WHY IT MATTERS
Kazatomprom first-half financials, 21 August 2026	Whether the volume growth came with margin, and whether financial guidance is revised alongside the reaffirmed production guidance.	The decisive test of whether the largest producer is chasing price or defending share. A guidance upgrade on volume would weaken the scarcity case considerably.

The term-minus-spot spread	Term at \$95.50 against spot at \$86.38 on 31 July. Watch whether the premium widens, or whether spot closes the gap.	A widening premium says utilities are still short of contracted cover. Spot converging upward would suggest the physical market, not just the contract market, has tightened.
First Oak Ridge centrifuge, by end-2026	Centrus has committed to completing its first centrifuge at Oak Ridge by year-end and raised Piketon hiring above 175.	The single most tangible measure of whether Western enrichment capacity is actually being built, as opposed to contracted for.
Russian enriched-uranium waivers	The internal view records that waivers under the US import ban decline annually and must end entirely by 1 January 2028.	A hard date on roughly a quarter of Western enrichment supply. Slippage would relieve the bottleneck; enforcement would tighten it sharply.
Rook I construction milestones	Construction was due to begin in the summer of 2026, with roughly four years to completion and a separate operating licence still required.	Every month of schedule slippage extends the deficit; every milestone met brings roughly 31 million pounds a year closer and shortens it.

EXPRESSION

Three postures, not one answer

Own the pound

A physical trust holds metal and nothing else. The Sprott vehicle held 81,697,348 pounds at 7 August 2026 with a net asset value of \$20.81 a unit. **The cost:** no operating leverage, no cash flow, a unit price that can trade away from asset value, and full exposure to precisely the spot market that has been flat for a month.

Own the chokepoint

Conversion and enrichment are where this edition locates the constraint, and the second-quarter numbers support that. **The cost:** a very small number of listed vehicles, valuations that already assume execution, dependence on federal contracting and licensing, and — in the clearest case — a stated reliance on continued Russian supply.

Own the miner

Producers offer cash flow, reserves and optionality on price. **The cost:** weather, grade, bridges and capital expenditure, plus realised prices set by contracts signed years ago — roughly \$70 a pound this quarter against a screen near \$86. The lag protects on the way down and withholds on the way up.

The companies named below are illustrative of how the theme is expressed in listed markets. They are NOT recommendations, and nothing in this edition is investment advice. Figures shown are the most recent independently verified reported figures with their dates, not live prices.

CCJ

Cameco Corporation

Adj. EBITDA \$391m
Q2 · 31 Jul 2026

The only listed company with meaningful positions in both halves of the argument: a large Canadian mining base and a share of Western conversion capacity, plus 49 per cent of Westinghouse. The second quarter showed the split clearly — a strong uranium segment, \$170m of pre-tax earnings on 7.1 million pounds sold, against a \$10m loss from Westinghouse. Inventory of 8.7 million pounds carried at \$58.05 a pound is a quiet store of value.

WATCH NEXT

Whether Cigar Lake's post-quarter difficulty forces the first change to 19.5–21.5 million pound guidance.

LEU

Centrus Energy Corp

Backlog \$4.5bn
Q2 · 5 Aug 2026

The cleanest listed expression of the enrichment bottleneck, and the only American-owned enricher. Second-quarter revenue of \$176.1m included \$153.4m from enrichment, up 22 per cent on 23 per cent lower volumes — pricing power in plain sight. A \$900m federal award for high-assay fuel was signed in the quarter, and cash stood at \$1.87bn. Guidance nonetheless assumes continued access to Russian material.

WATCH NEXT

Completion of the first Oak Ridge centrifuge by year-end, the test of build versus backlog.

KAP

Kazatomprom (NAC Kazatomprom JSC)

H1 13,291 tU, +9%
3 Aug 2026

The largest producer by volume and the single most important swing factor in the market. First-half output rose 9 per cent on a 100 per cent basis and 10 per cent attributable, with full-year guidance of 27,500–29,000 tonnes reiterated. Group realised pricing of \$70.79 a pound in the quarter, up 17 per cent, illustrates how far a producer's realisations sit below a spot price near \$86.

WATCH NEXT

First-half financial results on 21 August 2026, and any revision to financial as distinct from production guidance.

U.UN

Sprott Physical Uranium Trust

81,697,348 lbs
NAV \$20.81 · 7 Aug 2026

A closed-end vehicle that buys pounds and holds them, and in doing so removes them from the tradeable pool. Kazatomprom's own market commentary credits the trust with a substantial part of the 19 per cent rise in first-half spot transaction volumes — a rare case of a financial buyer visibly shaping a physical commodity market. It offers pure exposure to the pound and to nothing downstream of it.

WATCH NEXT

Whether the trust keeps buying into a flat spot market, or steps back and removes a marginal bid.

PDN

Paladin Energy Ltd

FY26 4.82 Mlbs
21 Jul 2026

The clearest single piece of evidence that supply can respond. Full-year production of 4.82 million pounds beat guidance of 4.5–4.8 million, and sales of 4.35 million pounds beat 3.8–4.2 million. Fourth-quarter realisations of \$70.6 a pound against unit costs of \$51.6 leave a healthy margin without any need for a higher price. Cash and investments stood at \$265m at 30 June.

WATCH NEXT

Patterson Lake South licensing, where construction hearings are targeted for completion by end-2027.

NXE

NexGen Energy Ltd

Licence granted
6 Mar 2026

The reason the deficit now has an end date. The Canadian Nuclear Safety Commission granted a licence to prepare site and construct Rook I on 6 March 2026, for output of up to 14 million kilograms of U₃O₈ a year — roughly 31 million pounds — across a 24-year life. First-year capital was put near C\$300m, with construction from summer 2026 and about four years to build. An operating licence is still required.

WATCH NEXT

Confirmation that construction actually began this summer, and the first schedule update against the four-year build.

The bottom line

What was repriced this year was not scarcity of uranium but scarcity of the industrial capacity that turns uranium into fuel. Spot is 20 per cent higher than a year ago yet flat over the past month, and producers are realising around \$70 a pound, not \$86. Meanwhile the term price has climbed above spot to levels last seen more than eighteen years ago, and the one listed enricher grew revenue 22 per cent on 23 per cent lower volumes. That is not what a shortage of rock looks like. It is what a shortage of milling looks like, in a market where 44 per cent of the milling sits in a jurisdiction Western buyers must leave by a fixed date.

The evidence is genuinely mixed, and the mixture matters. Kazakhstan added 9 per cent to first-half output, Paladin beat its guidance, and a licensed mine capable of roughly 31 million pounds a year is now under construction — three facts that sit badly with a thesis of inelastic supply, even allowing that none of them delivers a pound before 2030. The reasonable inference is that the fuel-cycle constraint is better founded than the mining constraint, and that the two have been priced as though they were the same thing. The next test is close at hand: Kazatomprom's first-half financials on 21 August will show whether the largest producer is being pulled into growth by profit or pushed into it by contract, and Centrus's first Oak Ridge centrifuge, promised by year-end, will show whether Western enrichment is being built or merely booked.

Editorial note. This edition is educational commentary prepared for internal use at Heyokha Brothers. It is not investment advice, not a recommendation, and not an offer or solicitation in respect of any security. Companies are named solely to illustrate how the theme is expressed in listed markets; their inclusion implies no view on their merits as investments. All external figures carry an as-of date and were verified against the sources listed below at the time of writing; markets move and figures date quickly. Internal material is drawn from the Heyokha research Wiki and represents the opinions of the named research providers, labelled as views rather than forecasts, and is not presented as verified fact. Where the internal view and the external record conflict, the conflict is stated and left unresolved rather than reconciled. Figures that could not be verified have been omitted rather than estimated.

Sources and update notes

(a) Internal. Wiki page **Uranium** (type: theme; status: active; tickers CCJ, URA, URM), created and last reviewed 2026-06-23. Sections used: Thesis; Mechanism; The enrichment bottleneck; the three bear-case subsections; Evidence & data; Companies; Contradictions; and the July and August 2026 updates. Provider issues, all 13D Research: **WILTW 23 July 2026** — source of the fuel-cycle reframe (conversion the tightest bottleneck, three Western providers; ceilings above \$150/lb, midpoints near \$120/lb; conversion prices up fourfold in two years, enrichment tripled; Centrus the sole US-owned enricher; Russian waivers ending by 1 January 2028; 28 NRC rule changes under EO 14300). **WILTW 2 July 2026** — spot \$85/lb, term \$95/lb, the \$125+/lb target, contract-coverage and inventory data, new mines adding 20–22M lbs against a 30–50M lb deficit, uranium at 4–8 per cent of reactor operating costs, \$17.5bn of DOE conditional loans. **WILTW 2 April 2026** — Q1 index +16.2 per cent, ~116M lbs contracted against a 200M+ lb replacement rate, no major new mine for three years. **WATMTU 9 August 2026** — index +11.5 per cent for the week. **WILTW 20 October 2022** — Russia at 40 per cent of conversion and 46 per cent of enrichment, sole HALEU supplier.

(b) Limitation on the internal view. All 32 source summaries feeding the Uranium page are 13D Research issues; no other provider on the platform contributes to it. The page's own Contradictions section reads, verbatim: *"None yet — only 13D sources in the compilation window."* That matters twice. The framing of uranium as a supply deficit with an inevitable price resolution is one house's thematic position, held since September 2022 and reiterated in every issue since — a structure in which confirming evidence accumulates more readily than disconfirming evidence. And the page was last reviewed on 23 June 2026, before all the results above; the July and August entries are appended updates, not a reviewed synthesis. Its bear case is correspondingly thin — three short paragraphs, no figures — so it was built here from external reporting and tensions inside the companies' own results, and is this edition's construction, not the Wiki's.

(c) External sources. (1) **Cameco Q2 2026 report, 31 Jul 2026** — net earnings \$25m; adjusted EBITDA \$391m (H1 \$899m); production 3.9M lbs, sales 7.1M lbs; inventory 8.7M lbs at \$58.05/lb; guidance unchanged at 19.5–21.5M lbs; Westinghouse a \$10m loss on \$163m adjusted EBITDA, against \$126m and \$352m a year earlier. (2) **Cameco price indicators, month-end 31 Jul 2026** — spot \$86.38/lb, long-term \$95.50/lb (UxC and TradeTech composite). (3) **Kazatomprom 2Q26 operations and trading update, 3 Aug 2026** — H1 production 13,291 tU (+9 per cent), 7,054 tU attributable (+10 per cent); Q2 7,147 tU (+8 per cent); group realised \$70.79/lb in Q2 (+17 per cent); guidance of 27,500–29,000 tU reiterated; H1 spot averaged \$86.83/lb against \$69.38/lb, +25 per cent, volumes +19 per cent; H1 financials due 21 Aug 2026. (4) **Centrus Energy Q2 2026 results, 5 Aug 2026** — revenue \$176.1m (+14 per cent); enrichment \$153.4m (+22 per cent); gross profit \$49.9m; net income \$16.8m; backlog \$4.5bn through 2040, ~\$3.7bn enrichment; \$900m DOE HALEU award; cash \$1,868.5m; SWU volumes –23 per cent at +3 per cent pricing; guidance assumes unchanged access to Russian LEU. (5) **Paladin Energy quarterly report to 30 Jun 2026, released 21 Jul 2026** — FY26 production 4.82M lbs against 4.5–4.8M lb guidance; sales 4.35M lbs against 3.8–4.2M lb; Q4 realised \$70.6/lb at \$51.6/lb unit cost; cash \$265m; CNSC sufficiency determination on Patterson Lake South, hearings by end-2027. (6) **World Nuclear News, 6 Mar 2026** — CNSC licence to prepare site and construct Rook I; up to 14 million kg U₃O₈ a year over 24 years; first-year capital about C\$300m; construction from summer 2026, about four years; operating licence still needed. (7) **WNA reactor table, updated 5 Aug 2026** — 441 operable reactors, 404,365 MWe, 2,698 TWh, about 9 per cent of world electricity; 79 under construction (85,846 MWe), 123 planned (112,389 MWe), 323 proposed; requirements 68,920 tU a year, or 81,273 t U₃O₈. (8) **WNA, uranium enrichment** — about 140,000 SWU for the annual fuel load of a 1,000 MWe light-water reactor; capacity roughly 61,500 thousand SWU a year (2022 basis) — Rosatom 44, Urenco 29, CNNC 14, Orano 12 per cent; enrichment almost half the cost of fuel, about 5 per cent of the cost of the electricity. (9) **Trading Economics, 7 Aug 2026** — uranium \$86.50/lb, +1.11 per cent on the month, +20.22 per cent on the year. (10) **Sprott Physical Uranium Trust, 7 Aug 2026** — 81,697,348 lbs held, NAV \$20.81 a unit. (11) **TradeTech, 30 Jun 2026** — long-term price \$97.00/lb, the highest in more than eighteen years. (12) **World Nuclear News, 22 Aug 2025** — 2026 guidance cut from 32,777 tU to 29,697 tU, about 10 per cent, on the stated basis that uncovered demand did not justify a return to full production. (13) **Yahoo Finance / Simply Wall St, 3 Feb 2026** — Cameco near C\$171.98, price-earnings around 142 times against an industry average near 16, about 33.6 per cent above one fair-value estimate. (14) **Investing News Network uranium review, Q2 2026** — spot entered the quarter at \$84.19/lb in an \$84–87 range; term reached \$94/lb after \$80/lb in Jun 2025.

(d) Editorial choices in this automated run. *Topic selection.* Entities in Wiki source summaries since 21 July 2026 were scored by recency, with a bonus for a headline mention, intersected with the 72 active theme pages. Gold ranked first, then AI Capex, gold miners and silver. All were set aside: AI Capex ran on 4 August and Gold Miners on 5 August, and gold, gold miners and silver are substitutes, so any would repeat inside the cooldown window. Uranium was the highest-scoring theme outside those clusters, at ten points, with a headline mention on 23 July. *What the cooldown check could not verify.* Essentially all of it. The **HB Wiki Learning** folder sits on the user's desktop, reachable only through the remote-devices bridge, which is never connected for scheduled runs; no such tool existed in this session, so no filenames were parsed and no 30-day cooldown set was built. The cooldown rests only on the two editions named in the brief — 2026-08-04 AI Capex and 2026-08-05 Gold Miners. Any other topic run in the past 30 days went undetected, so this edition may duplicate one. *Tool failures and degradations.* The Wiki theme listing exceeded the token limit and was queried with jq on disk. Conversion and SWU price indicators are subscriber-only at UxC and TradeTech, so 13D's claims that conversion quadrupled in two years and enrichment tripled are reported as characterisation, not fact. Live equity quotes could not be verified — yfinance and direct HTTP fetching are blocked here — so the cards carry dated reported figures, and the only valuation datapoint is stamped 3 February 2026. Enrichment shares are the latest the WNA publishes but rest on a 2022 basis.
