

Daily Need to Know

Monday, 7 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES · SETTLED FRIDAY 4 SEP 16:00 ET · 53 HOURS OLD · CLOSED ALL MONDAY FOR LABOR DAY			
S&P 500	7,718.60	▼ 29.11 · −0.38%	Opened at the day's high 7,750.19 and closed at 28% of its range . 1.26% below the 7,816.70 record. Volume 94% of the 10-day average on a payrolls day.
Nasdaq Composite	26,506.99	▼ 77.07 · −0.29%	Closed at 34% of range. Held up better than the Dow only because semis carried it; software was sold hard.
Dow Jones	53,414.25	▼ 271.86 · −0.51%	Worst of the three, closed at 36% of range. Volume 84% of average — the lightest of the majors.
Russell 2000	2,975.65	▲ 7.38 · +0.25%	Closed at 96% of its range . Small caps went out on the high while large caps went out on the low — the day's cleanest divergence.
Philadelphia SOX	11,735.26	▲ 383.13 · +3.37%	The single biggest number in the brief. Closed at 95% of range, yet still 19.9% below its 14,655 high. A violent bounce inside a bear trend, not a new high.
US INDEX FUTURES · LIVE, CAPTURED 09:45:02 · 3H 45M INTO AN ABBREVIATED LABOR DAY GLOBEX SESSION · CHANGE IS MEASURED FROM FRIDAY'S SETTLE			
E-mini S&P (ES)	7,719.75	◆ 2.25 · −0.03%	Range since the reopen just 8.5 points — 7,715.25 to 7,723.75. A holiday session with nobody in it. Friday settle 7,722.00.
E-mini Nasdaq (NQ)	29,585.00	◆ 19.75 · +0.07%	The only green index future, as it was on Friday. Range 29,530.50–29,595.75. Friday settle 29,565.25.
E-mini Dow (YM)	53,301	▼ 139 · −0.26%	The one future doing anything . 81-point range and the only one down more than a tick. Friday settle 53,440.
E-mini Russell (RTY)	2,976.80	◆ 0.20 · +0.01%	3.2-point range. Friday settle 2,976.60 — small caps have given back nothing of Friday's close-on-the-high.
US TREASURY YIELDS · SETTLED FRIDAY · CASH BOND MARKET SHUT ALL MONDAY FOR LABOR DAY · UNCHANGED SINCE THE 06:07 CAPTURE, AS EXPECTED			
US 10-year	4.784%	▲ 1.2bp	Sits at 73.3% of Hedgeye's 4.63–4.84 band. Friday's high 4.810% was 3bp from the ceiling.
US 30-year	5.244%	▼ 0.8bp	The only duration that fell. 30s10s compressed to 46.0bp — the long end refused to follow the front.
US 5-year	4.548%	▲ 2.6bp	The belly took the payrolls hit hardest in proportional terms.
US 2-year	4.374%	▲ 3.4bp	Highest since January 2025 . 10s2s down to 41.0bp — a hike, not a cut, is now the front-end's base case.
13-week bill	3.857%	▲ 1.9bp	10y–3m still +92.7bp positive. The curve is not inverting; it is bear-flattening from the front.
ENERGY & METALS · ALL LIVE, CAPTURED 09:45:02 · CHANGE MEASURED FROM FRIDAY'S SETTLE			
WTI crude (CL1!)	\$91.94	▲ 0.46 · +0.50%	Extended the Friday move overnight, range 91.58–92.57. Now 72.8% of the Hedgeye band , up 4.7 points of band since 06:07.
Brent (BZ1!)	\$96.68	▲ 0.40 · +0.42%	Through 96.5 with the Strait of Hormuz shut and Sunday's US strikes. Range 96.26–97.13.
Natural gas (NG1!)	\$2.929	▼ 0.046 · −1.55%	The largest band move of the morning . Fell from 67.4% to 47.4% of the 2.82–3.05 band — twenty points of band surrendered overnight against a bullish Hedgeye TREND.
RBOB gasoline	\$3.2030	▼ 0.012 · −0.36%	Gave back part of Friday's +2.54% even as crude rose. The crack narrowed back overnight.
Gold — spot	\$4,409.75	▼ 19.87 · −0.45%	Kept selling. Down to 28.8% of band from 32.1% at 06:07 — now in the bottom third and falling. 21.2% below its high.
Silver — spot	\$66.06	▼ 0.133 · −0.20%	51.1% of the 63–69 band. The only metal that did not extend its loss overnight — it is 0.1% higher than at 06:07.
Copper — spot	\$6.5306	▼ 0.011 · −0.16%	42.1% of band, down 4.0 points of band since 06:07. Three-and-three-quarter hours of real trading now sit behind this figure.
FX · LIVE, CAPTURED 09:45:02 — 4H 45M SINCE THE 05:00 GMT+8 REOPEN, AND TOKYO AND SEOUL ARE NOW OPEN			

Dollar index (DXY)	99.145	◆ -0.01%	Range 99.077-99.178. Still barely moved, but the band position has slipped to 54.7% from 57.1%. A hawkish repricing that the dollar has declined to confirm.
USD/JPY	156.070	▼ 0.13 · -0.08%	The yen has firmed slightly with Tokyo open, range 155.802-156.278. Not the repricing a 65% hike probability implies.
USD/KRW	1,343.23	▼ 2.49 · -0.19%	The won strengthened further. It traded as far as 1,334.77 — 0.81% stronger than Friday's close — on the day it was supposed to give Friday's rally back. See section 12.

VOLATILITY & CRYPTO · VIX IS FRIDAY'S SETTLE · BITCOIN IS LIVE AND HAS NOW ROLLED OVER

VIX	14.52	▲ 0.21 · +1.47%	Rose on a down day but only to 29.8% of the 13.75-16.33 band. Friday's low was 13.80 — under the band floor intraday. Does not trade today.
Bitcoin	\$79,854	▼ 490 · -0.61%	LIVE. Was up 0.04% at 06:07 and has since faded to -0.61%, high 80,434. 36.7% below the 126,230 high, and it has now given up on the Hormuz bid entirely.

▲ up · ▼ down · ◆ flat or within the noise of the capture window. Green is a rise and red a fall for every row **except the four Treasury lines, where the colour follows the bond price rather than the yield** — a yield rise is shown red because it is a loss for the holder.

Reconciliation: all rows are TradingView, captured 09:45:02-09:45:04 GMT+8 (2.2 seconds), replacing an earlier 06:07:25 capture that is retained only for the overnight comparisons explicitly labelled as such. Yahoo returned nothing on both passes; a Stooq fallback was attempted and is unreachable from this environment. The S&P, Dow and Nasdaq closes, the 10-year and 2-year yields and both crude marks were reconciled by hand against wire and vendor copy. Full detail in section 18.

TL;DR. August payrolls printed **+162,000 against a +53,000 consensus** — a three-fold beat that flipped the September FOMC into roughly a **65% probability of a rate hike** and drove the 2-year to **4.374%**, its highest since January 2025. Friday's index damage was modest (S&P -0.38%) but the internals were violent: the S&P, Nasdaq and Dow all closed in the bottom third of their ranges while the **Russell closed at 96% of its range and the SOX at 95%, up 3.37%**, led by memory — SanDisk +11.90% exactly on its high. Five of the Magnificent Seven fell. **Asia has now answered, and it chose the chips over the Fed: the KOSPI is up 2.93%** and the **Nikkei 2.17%** as Samsung and SK Hynix follow the US memory melt-up, while the won has *strengthened* a further 0.19% rather than surrendering Friday's rally. Hong Kong dissented at -0.47%. **US cash equity and bond markets are closed today for Labor Day**; futures are open but empty, with the S&P contract holding an 8.5-point range all session. Hedgeye's dashboard still prints **US Monthly Quad 1, US Quarterly Quad 4, Global Quad 3** — the Quad 2 shift is forecast, not yet booked — and the firm carries **zero semiconductor exposure and is short DRAM** into exactly the rally Asia is now paying for.

2 The big picture — what it means

1. The consensus was wrong by a factor of three, and the front end repriced instantly. Economists polled by Dow Jones looked for +53,000 August payrolls. The Bureau of Labor Statistics delivered **+162,000**, with unemployment steady at **4.1%**. Rate futures moved the September 15-16 FOMC from roughly even odds to about **65% for a 25bp hike** within the session. The 2-year yield rose 3.4bp to **4.374%**, the highest since January 2025; the 10-year rose 1.2bp to 4.784%; the 30-year *fell* 0.8bp to 5.244%. A curve that bear-flattens from the front while the long end declines is not pricing an inflation scare. It is pricing a central bank that is about to make a policy mistake in one direction or the other.

2. The index move was trivial. The internal move was not. The S&P fell 0.38%, opened at its high of 7,750.19 and closed at 7,718.60 — **28% of the day's range**. The Nasdaq closed at 34% of range, the Dow at 36%. Every headline index went out near its low. Simultaneously the Russell 2000 closed at **96% of its range** and the Philadelphia Semiconductor Index at **95%**, up 3.37%. Two populations of stock traded in opposite directions with equal conviction on the same day. That is a rotation, not a sell-off, and it is far more informative than the -0.38% headline.

3. Memory was the trade, and it was not close. SanDisk closed **+11.90% at 1,740.00 — exactly on its high**, on 140% of average volume. Micron rose 6.10% and closed at 98% of range on 141% of average volume. Western Digital +5.86%, Applied Materials +4.31%, AMD +4.69%, Intel +4.51%. Nvidia, the name everyone watches, managed only **+0.84% on 85% of average volume**. The bid was in commodity memory and NAND pricing, not in accelerator compute. Note the scale of the hole these names are climbing out of: even after Friday, Western Digital is **41.6% below** its 52-week high, Applied Materials 38.5% below, Micron 19.0% below.

4. Software was the funding leg, and the Mag7 paid. Workday fell 5.38%, Palantir 4.49%, Netflix 5.35% to 78.25 on 150% of average volume. Five of the seven mega-caps closed red: Tesla -5.92%, Apple -2.51%, Microsoft -2.04%, Alphabet -1.17%, Amazon -0.15%. Only Nvidia (+0.84%) and Meta (+1.00%) held. Combined Magnificent Seven capitalisation stands at **\$23.81tn**. Equal-weight S&P (RSP -0.48%) underperformed cap-weight (SPY -0.39%), so the breadth was not broad either — it was concentrated in one industry.

5. Hedgeye called the macro and was on the wrong side of the tape. Friday's *Early Look*, published 19:40 GMT+8, raised the probability of back-to-back monthly Quad 2s on a firmer inflation nowcast, and argued for higher yields, large caps over small, high beta over low, secular growth over value. The bond market delivered exactly that. But the equity expression Keith McCullough described on *The Macro Show* — **long AI software, effectively net short semis, zero semiconductor exposure, short computer memory** — met a day when semis rose 3.37% and

memory rose 6–12%, while small caps beat large. Print the inconvenient number: the macro thesis and the factor position diverged inside twenty-four hours of each other.

6. Asia has now voted, and it bought the chips rather than selling the Fed. Every Asian market closed on Friday four to five hours before payrolls, so this morning was their first chance to price it. The **KOSPI is up 2.93%** and the **Nikkei 2.17%**, both driven by Samsung, SK Hynix and the memory complex following Friday's American melt-up, while the won has *strengthened* a further 0.19% and touched 1,334.77 — 0.81% through Friday's close. Hong Kong, with no memory complex, is the sole dissent at −0.47%. A fifteen-point jump in US hike probability produced a rally in the two markets most exposed to it. Either the industry cycle is currently a bigger force than the policy rate, or the policy rate move is not believed; the honest position this morning is that we do not yet know which.

7. The American market is shut and its futures are empty. The NYSE, Nasdaq and the US bond market are closed all day for **Labor Day**, and the abbreviated Globex session has produced an **8.5-point range in the S&P contract across three and three-quarter hours**. Every Treasury yield in this brief is identical to its 06:07 reading because the cash market has not opened. Tuesday's US open therefore has to absorb the payrolls print, a weekend of Middle East escalation and now a 2.93% Korean rally, all at once. Thin liquidity plus a full news load is the setup that produces gaps.

8. Oil is the variable nobody can hedge and everybody has to own, and it kept going overnight. WTI has added 0.50% since the reopen to **91.94** and Brent 0.42% to **96.68**, trading through 97 intraday, with the **Strait of Hormuz closed to commercial shipping** and the United States having struck again on Sunday. Brent is up roughly 21% in a month and 47% year on year. That single series is what lifted Hedgeye's CPI nowcast to 3.55%, what drives the Quad 2 call, and what makes Friday's CPI print the week's real event. Meanwhile gold fell a further 0.45% overnight to **28.8% of its risk range**, and is 21.2% below its high; silver is 45.7% below its own. Hard assets are not moving together — energy is being repriced by supply and precious metals by rates — and four hours of live trading have now confirmed what seven minutes only hinted at.

3 Rates, currencies & commodities

- **The front end did the work.** 2s +3.4bp to 4.374%, 5s +2.6bp to 4.548%, 10s +1.2bp to 4.784%, 30s −0.8bp to 5.244%. 10s2s compressed to **41.0bp**, 30s10s to **46.0bp**, 10y-3m still positive at **92.7bp**. This is a hike being priced, not a term-premium event.
- **Bond volatility is not confirming the stress.** The MOVE index fell 2.11% to **73.10**, its session low, and remains a long way under the 115.02 high of the past year. Rates repriced without the options market paying up for it — which usually means positioning, not panic.
- **Credit did nothing at all.** HYG −0.06% to 79.16, LQD −0.02% to 105.48, TLT +0.17% to 82.21. On a day that moved the September Fed probability by fifteen points, spreads did not blink. Either credit is complacent or the equity rotation is genuinely an equity story.
- **The dollar has now answered, and the answer is no.** DXY at 99.145 has slipped to **54.7% of its band from 57.1%** across a full Asian morning, with a range of just 10bp. McCullough sold currency exposure to minimum on Thursday after the dollar ran from the top of its range to the bottom in a day. A 65% hike probability that produces a *weaker* dollar four hours later is the single most awkward fact on this page.
- **The won did not give the rally back — it added to it.** USD/KRW closed Friday at 1,345.72 after a 0.77% won appreciation earned *before* payrolls landed at 20:30 GMT+8. The obvious call was that Korea closed dovish and would reopen hawkish. Instead the won is at **1,343.23**, a further 0.19% stronger, having touched 1,334.77. USD/TWD is unchanged. Asia declined to trade the Fed.
- **Natural gas is the morning's biggest single move and it went the wrong way for the consensus.** It rose 2.13% on Friday to press the top of its 2.82–3.05 band, then fell **1.55% overnight to 2.929** — from **67.4% to 47.4% of the band, twenty points surrendered in under four hours**, against a bullish Hedgeye TREND. RBOB did the same in miniature, +2.54% Friday and −0.36% overnight, so the refining crack that widened on Friday has partly closed. Crude alone extended. Wheat fell 2.68% Friday to 734.00 — the inflation is in the barrel, not in the grain.
- **Precious metals are the counter-trade to the hike, and the overnight session confirmed it.** Gold spot fell a further 0.45% to **4,409.75**, taking it from 32.1% to **28.8% of its band** — the bottom third, and still falling. Silver at 66.06 is the one metal that firmed after 06:07, and sits at 51.1% of a neutral band. Hedgeye removed silver (SLV) from its long book on Friday at 10:34 ET, having flagged Quad 2 as a shorter-term negative for gold while remaining structurally bullish. Four hours of live trading have vindicated the shorter-term half of that.

4 Hedgeye — regime, risk ranges & the Quad path

MACRO DASHBOARD	READING	SOURCE & TIME (GMT+8)
Macro Dashboard — as printed	US MONTHLY: QUAD 1 (Growth ↑ Inflation ↓, Pro-Growth Positioning) · US QUARTERLY: QUAD 4 (Defensive + Volatility Assets) · GLOBAL: QUAD 3 (Stagflation Protection)	Macro Week Summary Notes PDF, Sat 5 Sep 04:50 GMT+8

VIX Gauge	14.53 — inside the "Investable Bucket" (VIX 9-19), below the Chop Bucket at 20-29	Macro Week Summary Notes PDF
Quad call — September	Shifting from Quad 1 to Quad 2 on a higher inflation nowcast	Early Look, Fri 4 Sep 19:40
Quad call — October	Quad 2 ; December and January also Quad 2	Early Look, Fri 4 Sep 19:40
Explicit Quad <i>path</i> notation	Still not obtained. The current-state dashboard above was recovered this run by screenshotting the Macro Week Summary Notes PDF. The forward <i>path</i> table sits on page 2 of that PDF, which Chrome's viewer would not page to and which exposes no extractable text. The dashboard reads Quad 1 today while the Early Look argues for Quad 2 — so the shift is forecast, not booked	Macro Week Summary Notes PDF, page 1 read; page 2 unreachable
CPI nowcast	3.55% , up 5-6bp on the week, helped by oil at three-month highs	The Macro Show, Fri 4 Sep 23:48
Factor regime	High Beta Momentum (long semis / short software) -77% from its June peak; long AI software vs short semis +17.9% over the past month	Early Look, Fri 4 Sep 19:40
Semiconductor exposure	Zero. Net short semis versus long software; short computer memory / DRAM	The Macro Show, Fri 4 Sep 23:48
Bond volatility	MOVE at 73.10 — consistent with the "investable VIX bucket, buy dips" framing	Our capture, 06:07:25
Position changes disclosed Friday	Sold all Turkey (TUR) and all NOBL on a broken TREND. ETF Pro: added long Wheat (WEAT); added short Technology Momentum (PTF), Industrials Momentum (PRN), Quality Momentum (JOET); removed long Euro (FXE) and Silver (SLV)	Macro Show 23:48; ETF Pro Plus, Fri 4 Sep 22:34
Signal Strength Stocks	62 names. Added PBR, AR, WFC, RRC. Removed TRU, AMZN, EFX, EXPGY, MCO, PM, ETSY, CXXIF	Signal Strength Stocks, Fri 4 Sep 23:32

The Macro Show summary notes are AI-generated and carry Hedgeye's own error caveat. They are reported here as attributed summary, outside quotation marks, and are not treated as verbatim.

RISK RANGE™ SIGNALS — THE LIVE SET

INSTRUMENT	IMMEDIATE-TERM RANGE	TREND	NOW	WHERE IT STANDS
10-Year UST Yield	4.63 - 4.84	bullish	4.784	73.3% of band. 5.6bp from the ceiling. Friday's 4.810% high came within 3bp of it.
High Yield (HYG)	79.00 - 79.55	bullish	79.16	29.1%. Near the floor of a very narrow 0.55-wide band.
Inv. Grade Credit (LQD)	104.9 - 106.3	bearish	105.48	41.4%. Mid-band; the short has neither worked nor hurt.
S&P 500 (SPX)	7,632 - 7,781	bullish	7,718.60	58.1%. 62 points of headroom, 87 points of downside to the floor.
NASDAQ Composite	26,001 - 26,798	bullish	26,506.99	63.5%. Upper half despite the down day.
Russell 2000 (RUT)	2,917 - 3,013	bullish	2,975.65	61.1% — and rising while the Macro Show flags small caps as a bearish position. Watch this one.
Health Care (XLV)	169 - 177	bullish	171.45	30.6%. A bullish TREND trading near its floor after -1.04% Friday.
Tech-Software (IGV)	102 - 113	bullish	n/a	Not captured — IGV is not in the capture universe. Position within band unknown this morning.
Oil Services (OIH)	411 - 440	bullish	n/a	Not captured. Position within band unknown this morning.
Volatility (VIX)	13.75 - 16.33	bearish	14.52	29.8%. Friday's 13.80 low sat 5bp above the band floor intraday.
US Dollar Index (USD)	98.51 - 99.67	bearish	99.172	57.1%. Upper half of a bearish-TREND band, which is where a bearish signal is most uncomfortable.
Light Crude Cont. (WTIC)	84.74 - 94.63	bullish	91.48	68.1%. Measured on NYMEX:CL1!, the continuous contract Hedgeye names.
Natural Gas Cont.	2.82 - 3.05	bullish	2.975	67.4% and climbing. Measured on NYMEX:NG1!.
Gold Spot	4,296 - 4,691	bullish	4,422.91	32.1% — lower third. Measured on spot (TVC:GOLD), as published.
Copper Spot	6.40 - 6.71	bullish	6.5430	46.1% . Measured on spot (OANDA:XCUUSD), as published.
Silver Spot	63 - 69	neutral	65.9995	50.0% — dead centre. Hedgeye removed the SLV long on Friday.

Series discipline matters. Reading these three bands on futures instead of the published spot series would have put gold at 45.7% instead of 32.1%, copper at **91.1%** instead of 46.1%, and silver at 62.5% instead of 50.0%. The spot-to-futures basis this morning is \$53.70 on gold (1.21%), \$0.749 on silver (1.13%) and \$0.1395 on copper (2.13%).

Band moves versus the prior session: UNKNOWN. The Early Look category page at /feed_items/all?page=N&with_category=24-early-look does not paginate — pages 1 and 2 both returned the 4 September note — and no other route to Thursday's Early Look resolved this morning. Floor moves, ceiling moves and band-width changes are therefore not reported. They are not unchanged; they are unmeasured.

WHAT KEITH ACTUALLY SAID

From the *Early Look*, "#Quad2 Then #Quad2?", published Friday 4 September 07:40 ET / **19:40 GMT+8**:

- "BREAKING: Hedgeye's Inflation Nowcast Ticks Higher For Both SEP and OCT - Upping Monthly Quad2 Probability."
- "Bond Yields continues to TREND higher (irrespective of what government guys try to do short-term)"
- "LARGE Cap performance starts beating SMALL Cap (in #Quad1 it's the other way around)"
- "Did you know that High Beta Momentum (Long Semis vs. Short Software) has crashed -77% from its June #MOAB highs?"

The *Macro Show* summary of Friday 4 September 11:48 ET / **23:48 GMT+8** — reported as attributed summary, not verbatim, because Hedgeye labels these notes AI-enhanced and possibly erroneous — records McCullough saying the jobs number came in hawkish at 162K against 55K expected; that a better jobs report plus a higher CPI should push yields higher; that TLT is the biggest short in the book; that he sold gold aggressively after the dollar ran to the low end of its range, calling it one of his more aggressive one-day sales in any asset class in the last year; that Hedgeye has zero semiconductor exposure and is effectively net short semis versus long software; that Korea's KOSPI bounced but did not get above TRADE and is near the top of the list for incremental shorts; and that Tier1 Alpha estimated roughly **\$14bn** of expected flow buying hit on Thursday.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Nvidia (NVDA)	230.36	+0.84%	\$5.55tn	Green but limp — 85% of average volume on a day the SOX rose 3.37%. The bid was in memory, not accelerators. Just 2.6% below its 236.54 high, the least damaged of the seven.
Apple (AAPL)	319.97	-2.51%	\$4.67tn	Worst mega-cap after Tesla, on 107% of average volume, closing near the low of a 317.86-328.93 range. Its product event is Wednesday.
Alphabet (GOOGL)	338.46	-1.17%	\$4.12tn	McCullough noted it bounced but did not go bullish TREND. 17.2% below its 408.61 high.
Microsoft (MSFT)	499.70	-2.04%	\$3.71tn	Lost the 500 handle intraday (low 499.36) and closed on it. Named a long on the Macro Show — this is the software leg taking the funding hit.
Amazon (AMZN)	258.51	-0.15%	\$2.79tn	Barely moved, but was removed from Hedgeye's Signal Strength Stocks list on Friday.
Meta (META)	616.77	+1.00%	\$1.57tn	Only other green name. McCullough said it flipped to bullish TREND "barely", and that the move was beta and flow, not news. Still 22.0% below its high.
Tesla (TSLA)	354.08	-5.92%	\$1.40tn	The day's mega-cap casualty, on 154% of average volume . Cybercab event underwhelmed and NHTSA opened an audit query into how Tesla self-certified the vehicle without a steering wheel, pedals or mirrors. 29.0% below its high.

Combined capitalisation \$23.81tn, of which five names fell. Market caps are TradingView's market_cap_basic at the Friday close and will not match share-count-adjusted vendor figures to the last decimal.

6 Positioning & options

- **Volume was below average on the year's most-anticipated payrolls print.** S&P volume ran at 94% of its 10-day average, Nasdaq 88%, Dow 84%. A three-fold consensus miss that shifted the Fed by fifteen probability points did not bring incremental participation to the index. The turnover was inside single names.
- **Where the volume actually went.** Tesla 154% of average, Netflix 150%, Micron 141%, SanDisk 140%, AMD 125%, Oracle 127%, Broadcom 123%, Intel 119%. Against that: Nvidia 85%, Workday 66%, Palantir 90%. Money was rotating between industries, not adding or reducing net exposure.
- **Dealer gamma is positive and that is not a bullish signal.** McCullough's framing on Friday's Macro Show: positive gamma means dealers sell strength and buy weakness. Tier1 Alpha put roughly **\$14bn** of expected flow buying into Thursday's tape. With the S&P at 58.1% of its risk range there is limited headroom, which is the mechanical argument for selling rallies into the FOMC.
- **VIX rose on a down day but stayed cheap.** 14.52, +1.47%, at 29.8% of the 13.75-16.33 band, with an intraday low of 13.80. Nobody paid up for protection ahead of a holiday weekend containing an active Middle East war. That is the single most complacent number on the page.
- **Hedgeye's book turned more defensive at the factor level, not the index level.** Three momentum shorts added on Friday — Technology Momentum (PTF), Industrials Momentum (PRN), Quality Momentum (JOET) — plus

a wheat long, with the euro and silver longs removed. That is a book positioning for factor dispersion, which is precisely what Friday delivered.

- **Equal weight lagged cap weight.** RSP −0.48% against SPY −0.39%. Even the small-cap and semiconductor strength was too narrow to lift the average stock.

7 Sector rotation — leaders & laggards

SPDR SECTOR	LAST	DAY	NOTE
Technology (XLK)	187.28	+0.70%	The only meaningful gainer, and entirely semiconductors — SOXX +3.52%, SMH +2.61%.
Industrials (XLI)	175.27	+0.41%	Green on a hot-payrolls read. Hedgeye added a short in Industrials Momentum the same day.
Utilities (XLU)	43.08	+0.12%	Marginally green despite the rate move — awkward for the Quad 2 short-XLU thesis.
Materials (XLB)	52.44	−0.34%	Copper flat, so no commodity lift.
Real Estate (XLRE)	43.93	−0.72%	The clean rate-sensitive loser. 2s at a 20-month high does this.
Financials (XLF)	58.10	−0.79%	Fell despite a steeper hike path — a curve that bear-flattens does not help net interest margin.
Staples (XLP)	84.58	−0.80%	Defensives lost, exactly as the Quad 2 playbook predicts.
Energy (XLE)	64.06	−0.87%	Red with Brent up 0.80% and Hormuz shut. The equity is not believing the barrel.
Health Care (XLV)	171.45	−1.04%	A Hedgeye long, now at 30.6% of its band. Lilly −0.88%, UnitedHealth −0.95%, J&J −1.15%.
Comm. Services (XLC)	112.03	−1.19%	Netflix −5.35% did most of the damage.
Cons. Discretionary (XLY)	114.91	−1.33%	Worst sector. Tesla is roughly a fifth of it.

- **Leaders:** Technology, Industrials, Utilities — three of eleven green, and only one of them for a reason anyone would call thematic.
- **Laggards:** Discretionary, Communication Services, Health Care. Two of the three were single-name events (Tesla, Netflix) rather than sector repricing.
- **The rotation that matters is inside Technology, not between sectors.** XLK +0.70% conceals semis +3.4% against software −2% to −5%. A sector-level view of Friday tells you almost nothing true.
- **Energy red on a Hormuz weekend is the anomaly to carry into Tuesday.** If oil holds above \$90 and XLE keeps lagging, either the equity is wrong or the market is treating the supply shock as temporary.

8 Forward — futures & the week ahead

The overnight tape exists but is nearly empty. Globex reopened at 06:00 GMT+8 and the S&P contract has traded an **8.5-point range in three and three-quarter hours**; the Dow contract, at −0.26%, is the only one with a pulse. Spot FX has run for four and three-quarter hours and moved the dollar index 10bp. The real activity is in Asian cash equities, where the **KOSPI is up 2.93%** and the **Nikkei 2.17%** on the memory complex, and in energy, where WTI added 0.50% and natural gas lost 1.55%. Bitcoin, at 79,854 and 36.7% below its high, has faded from +0.04% at 06:07 to −0.61% and never bid on the weekend's escalation at all. **US cash equity and bond markets are closed all day today for Labor Day** — every Treasury yield here is unchanged from the 06:07 capture for exactly that reason — so the first genuine American price on any of this arrives at Tuesday's open.

DAY (GMT+8)	KEY EVENTS
Mon 7 Sep	US markets closed — Labor Day. NYSE, Nasdaq and the US bond market shut; CME equity futures abbreviated. Asia and Europe trade normally and must price Friday's payrolls unaided. Fed blackout ahead of the 15-16 September FOMC began Saturday 5 September.
Tue 8 Sep	US markets reopen 21:30. First American cash print on a three-fold payrolls beat, a 65% hike probability and a weekend of Middle East escalation, all at once.
Wed 9 Sep	Apple product event — iPhone 18 Pro and Pro Max expected, plus a foldable model. Apple closed Friday −2.51% and 7.1% below its high.
Thu 10 Sep	August PPI , consensus +0.4% m/m, before the US open. Oracle Q1 earnings after the close — the stock is 54.1% below its 52-week high and rose 3.08% Friday on 127% of average volume. Adobe, Casey's, American Eagle and Macy's also report.

Fri 11 Sep	August CPI , consensus +0.4% m/m, before the US open. The week's decisive print: Hedgeye's nowcast is 3.55% and McCullough expects bond managers to front-run it. A hot number cements the hike; a soft one unwinds Friday's entire repricing.
Ahead	FOMC 15-16 September. A Xi-Trump summit, plus UN, SCO and BRICS+ summits, are scheduled during September.

Earnings dates are from secondary calendars and are **unconfirmed** against company IR pages; the Oracle and Adobe reporting dates in particular should be verified before being traded on.

9 Corporate news

- **Tesla -5.92% to 354.08.** A private Austin event on the Cybercab left the core autonomy questions unanswered, and the NHTSA opened an audit query into how Tesla self-certified the vehicle and why it judged that standards requiring a steering wheel, pedals and mirrors do not apply. 154% of average volume. Reported by CNBC and The Motley Fool.
- **SanDisk +11.90% to 1,740.00, closing exactly on its high**, on 140% of average volume — the largest single-name move in the capture universe. Micron +6.10% to 1,016.59 (98% of range), Western Digital +5.86%, Applied Materials +4.31%. Wire and vendor coverage of the same session variously reported SanDisk at "more than 5%", "8%" and "10%"; the settled close is +11.90% and that discrepancy is documented in section 18.
- **AMD +4.69% to 477.57 and Intel +4.51% to 95.80.** Intel traded 119% of average volume. Both remain heavily impaired — AMD 18.3% and Intel 32.7% below their 52-week highs.
- **Netflix -5.35% to 78.25 on 150% of average volume**, closing at 78.23 low tick. The stock is **38.2% below** its 126.70 high. One outlet reported a 68.95 print as a fresh 52-week low; our capture shows a 52-week low well above that and the claim is not corroborated — treat it as unverified.
- **Workday -5.38% to 195.79** on only 66% of average volume — a sharp fall on thin participation, which is a lower-quality signal than the memory rally. Palantir -4.49% to 174.33.
- **Oracle +3.08% to 158.78** on 127% of average volume, into Thursday's earnings. The stock has lost 54.1% from its 345.72 high inside a year — the largest drawdown of any mega-cap in the capture set.
- **Hedgeye Signal Strength Stocks** added Petrobras (PBR), Antero Resources (AR), Wells Fargo (WFC) and Range Resources (RRC) — three of four energy — and removed TransUnion, Amazon, Equifax, Experian, Moody's, Philip Morris, Etsy and CXXIF. The additions are an energy tilt; the removals are a data-and-ratings cluster.

10 Macro data

- **US non-farm payrolls, August: +162,000 actual against +53,000 consensus** (Dow Jones survey). A beat of 109,000 jobs, or roughly three times expectations. This is the number that moved everything.
- **Unemployment rate: 4.1% actual, 4.1% consensus** — in line, and steady on the month. The beat was entirely in job creation, not in the household survey.
- **The July comparison is the context.** August's print came in "well above last month's low number", per Hedgeye's Daryl Jones on the Macro Show. In early August, weak July payrolls had caused September hike odds to *tumble*. One month later they are back near 65%. Two consecutive months of large consensus errors in opposite directions is a labour-market signal problem, not a labour-market trend.
- **Fed pricing: roughly 65% probability of a 25bp hike at the 15-16 September FOMC**, up from about 50% the day before the release. One source put the figure at 58.4%; the range across providers is documented in section 18.
- **Hedgeye CPI nowcast: 3.55%**, up 5-6bp over the week, attributed to oil returning to three-month highs.
- **Still to come this week:** August PPI Thursday, consensus +0.4% m/m; **August CPI Friday, consensus +0.4% m/m**. Both land inside the FOMC blackout that began Saturday 5 September, so there will be no Fed commentary to interpret them.

11 Geopolitics

- **▲ The Strait of Hormuz is reported closed to commercial shipping.** US-Iran strikes resumed on 1 September after roughly a month's pause. CENTCOM says its strikes targeted IRGC air defence, radar, maritime, mine-laying and communications facilities, framing the operation as a response to Iranian efforts to lay naval mines in the strait. This is the standing fact behind Brent at \$96 and a 47% year-on-year move in crude.
- **▼ Iran retaliated against three US-partner states.** Missile and drone attacks were reported on Kuwait, Bahrain, Jordan and Iraq. Iran's Revolutionary Guards said Camp Titin in Jordan came under what they described as an intense ballistic missile attack; air-raid sirens sounded in Bahrain. These are claims by the parties involved and casualty figures are contested.
- **▼ The United States struck again on Sunday**, targeting what it said were Iranian launchers preparing to fire rockets into the strait. President Trump warned Tehran that further retaliation would bring a stronger response, and said publicly that renewed hostilities would not last "too long" — signalling escalation rather than an immediate return to the earlier ceasefire.

- ◆ **Ukraine diplomacy moved over the weekend.** Steve Witkoff and Jared Kushner spent more than three hours with President Putin in the Kremlin on Saturday, then met President Zelenskyy in Kyiv on Sunday; both American and Russian officials described the talks positively. Reporting suggests the American side wants the war ended before winter while Ukrainian officials doubt Russia will negotiate seriously before spring or summer 2027. Nothing has been agreed.
- ◆ **Germany's Alternative für Deutschland led a regional election** on the weekend, with exit polls leaving it unclear whether the party can form what would be the country's first far-right state government since the Second World War. European risk assets have not yet traded on it.
- ◆ **September's diplomatic calendar is unusually loaded** — a Xi-Trump summit plus UN, SCO and BRICS+ meetings. Any of these can move energy and the dollar without an economic release attached.

12 Overnight setup — what Asia opened into, and what it did

Asia had one question to answer this morning and it answered it in the first hour: semiconductors beat the Federal Reserve. Every Asian cash market closed on Friday four to five hours *before* the payrolls release, having rallied on dovish expectations that the +162,000 print destroyed. The obvious trade was that Korea and Japan would open lower and the won would surrender its 0.77% Friday gain. That is not what happened. The **KOSPI is up 2.93%**, the **Nikkei up 2.17%**, and the won has strengthened a *further* 0.19%, touching 1,334.77 at its best. Samsung and SK Hynix — which between them dominate the KOSPI — are following Friday's US memory melt-up, and that pull has overwhelmed a fifteen-point jump in US hike probability. Hong Kong, which has no memory complex to lean on, is the dissent at -0.47%.

INSTRUMENT	LEVEL	CHANGE	RANGE	STATUS AT 09:45:02 GMT+8
ASIAN CASH EQUITIES · LIVE · FIRST SESSION TO PRICE THE AUGUST PAYROLLS BEAT				
KOSPI	6,882.85	▲ +2.93%	6,867.91-6,923.64	LIVE — the day's biggest move anywhere. Still 26.7% below its 52-week high
Nikkei 225	66,434.51	▲ +2.17%	65,600-66,471	LIVE — through 66,000, near session high. 8.8% below its high
Hang Seng	25,531.24	▼ -0.47%	25,501-25,665	LIVE — the only major Asian index lower. 9.0% below its high
Shanghai Composite	3,942.51	▲ +0.32%	—	Delayed feed, just open
ASX 200	9,012.70	◆ +0.08%	9,001.60-9,044.50	LIVE, delayed 20 min — no conviction either way
Sensex	76,515.43	◆ 0.00%	—	Friday close — India does not open until 12:15 GMT+8
US FUTURES · LIVE BUT ABBREVIATED AND EMPTY · CHANGE FROM FRIDAY'S SETTLE				
ES (E-mini S&P)	7,719.75	◆ -0.03%	7,715.25-7,723.75	8.5-point range in 3h 45m
NQ (E-mini Nasdaq)	29,585.00	◆ +0.07%	29,530.50-29,595.75	Green, in line with the Asian semiconductor bid
YM (E-mini Dow)	53,301	▼ -0.26%	53,255-53,336	The only future with a pulse
RTY (E-mini Russell)	2,976.80	◆ +0.01%	2,974.50-2,977.70	Has given back none of Friday's close-on-the-high
FX, COMMODITIES AND CRYPTO · ALL LIVE				
USD/JPY	156.070	▼ -0.08%	155.802-156.278	Yen firmer with Tokyo open — the opposite of the hawkish read
USD/KRW	1,343.23	▼ -0.19%	1,334.77-1,345.72	Won stronger again. Best level 0.81% through Friday's close
USD/TWD	31.6188	◆ 0.00%	31.562-31.626	Flat despite Taiwan's semiconductor leverage
USD/CNH	6.7097	◆ +0.04%	6.7042-6.7103	6bp range — the renminbi is doing nothing
EUR/USD	1.1614	◆ +0.01%	1.1604-1.1620	16-pip range across the whole reopen
Gold spot	4,409.75	▼ -0.45%	4,389.86-4,435.15	Kept selling; 28.8% of band
Silver spot	66.06	▼ -0.20%	65.556-66.448	The one metal that firmed after 06:07
Copper spot	6.5306	▼ -0.16%	6.5257-6.5539	42.1% of band and drifting lower

WTI crude	91.94	▲ +0.50%	91.58-92.57	Extended overnight on Sunday's strikes
Brent crude	96.68	▲ +0.42%	96.26-97.13	Traded through 97 intraday
Bitcoin	79,854.19	▼ -0.61%	79,830-80,434	Faded from +0.04% at 06:07
Ether	2,500.22	▼ -0.60%	2,499.74-2,522.21	Same fade; 47.5% below its high

- **The sector handover worked exactly as the US tape suggested; the macro handover did not.** Semiconductors led in Seoul and Tokyo just as they led in Philadelphia. But nothing in Asia priced a 65% hike probability — the won firmed, the yen firmed, the dollar index slipped to 54.7% of its band from 57.1%. Either Asia is trading the industry and ignoring the rate, or the rate move is not believed.
- **Korea is the position to watch, and it is running against Hedgeye.** McCullough said on Friday that the KOSPI had bounced but not reclaimed TRADE, that Korea was bearish on both TRADE and TREND, and that it sat near the top of his list for incremental shorts. It is up 2.93% this morning. That is the second consecutive session in which the semiconductor tape has run the other way from the firm's stated equity posture.
- **The KOSPI's 2.93% needs its context printed.** The index is still **26.7% below** its 52-week high of 9,385.59 — much the deepest drawdown of any major index in this brief. This is a violent rally inside a large hole, which is precisely what the SOX did on Friday.
- **Natural gas is the morning's real casualty and nobody will lead with it.** Down 1.55% and through twenty percentage points of its Hedgeye band in under four hours, from 67.4% to 47.4%, against a bullish TREND. That is the largest single band move of the session and it happened while attention was on Korean chips.
- **Crude and gold moved in opposite directions again.** WTI added 0.50% overnight to 72.8% of its band on Sunday's US strikes; gold fell 0.45% to 28.8% of its band. The war premium is going into the barrel and nowhere else — for the second session running, and now with three and three-quarter hours of genuine trading behind both figures rather than seven minutes.
- **The instrument most likely to move from here is still USD/KRW, but the direction has flipped.** The won has now absorbed the payrolls print and strengthened through it. If Seoul closes at these levels, the pre-payrolls Friday rally was not stale at all — it was early, and the Fed repricing is the thing that has yet to be believed.

13 AI watch

- **The AI trade split into hardware and software on Friday, and hardware won decisively.** Memory and storage names rose 4-12% while Workday fell 5.38% and Palantir 4.49%. This is a direct reversal of the factor Hedgeye has been paid on all summer — long AI software versus short semis, up 17.9% over the past month — inside a single session.
- **The constraint has shifted from chips to electricity.** Nvidia agreed in August to back **\$105bn** of financing for an OpenAI data centre in Ohio to be built by SB Energy, which itself came to market on 1 September. Global data-centre power demand is projected to exceed 200GW by 2030. When the marginal AI input is a grid connection rather than a wafer, the marginal AI investment becomes an energy investment.
- **Oracle is the week's read on whether AI capex converts to revenue.** It reports Thursday, up 3.08% on Friday and **54.1% below** its 52-week high — the sharpest de-rating of any large AI infrastructure name in the capture set. The stock is priced for disappointment; the backlog commentary is what matters.
- **Anthropic and Microsoft have both announced new data-centre projects** as the industry construction push continues, with Anthropic's compute split across Amazon and, more recently, Google.
- **Unverified:** one AI trade publication reported that Nvidia has agreed to acquire Hugging Face for **\$12.93bn**. No wire service or company release corroborating this was found this morning. Treat it as a single-source claim, not a fact.

14 Beyond the markets

- **Gold is 21.0% below its 52-week high and silver is 45.8% below theirs**, in the same week that Brent went up 47% year on year and a strait carrying a fifth of the world's seaborne oil closed. The precious-metals hedge did not work for the geopolitical event it exists to hedge. Rates beat war.
- **Bitcoin, at 79,857 and 36.7% below its high, did not bid on the weekend's escalation either.** Ether is 47.5% below its high. Two assets sold to institutions as uncorrelated stores of value spent a weekend of active military conflict doing nothing at all.
- **The consensus for August payrolls was wrong by 109,000 jobs, one month after being wrong in the opposite direction.** The forecasting error, not the data, is now the largest source of realised volatility around US labour releases.

- **Applied Materials is 38.5% below its 52-week high and Western Digital 41.6% below theirs — after a week in which both rose more than 4%.** The semiconductor bounce everyone will write about on Tuesday is happening from a level that still represents a bear market in the underlying names.
- **Three of the four names Hedgeye added to Signal Strength Stocks on Friday are energy** — Petrobras, Antero, Range Resources. The fourth is a bank. Nobody will lead with a screen that quietly rotated into hydrocarbons on the same day the Strait of Hormuz stayed shut.
- **The Fed goes into blackout on Saturday and comes out after the decision**, which means both the PPI and the CPI prints this week land with no official commentary attached. Markets will have to price two inflation releases entirely on their own for the first time in months.

15 Appendix — stock cards

SNDK · SANDISK**1,740.00 +11.90%**

Cap \$254.8bn · closed exactly on its high · 140% of avg volume · 26.1% below 52wk high 2,354.39 · no published Hedgeye band

The largest single-name move in the capture universe and a textbook accumulation close — up 11.9% and going out at the session high on 40% excess volume. NAND pricing is the driver. Hedgeye is short computer memory.

MU · MICRON**1,016.59 +6.10%**

Cap \$1,148.1bn · closed at 98% of range · 141% of avg volume · 19.0% below 52wk high 1,255.00

Reclaimed the 1,000 handle and held it into the bell. A trillion-dollar memory company is a novel object; it is also still nearly a fifth below its high, which is the part the coverage will omit.

NVDA · NVIDIA**230.36 +0.84%**

Cap \$5,551.7bn · 85% of avg volume · 2.6% below 52wk high 236.54 · named a long on Friday's Macro Show

The least damaged mega-cap and the least impressive performer on a +3.4% SOX day, on below-average volume. When the semiconductor bid arrives without Nvidia, the bid is about pricing, not compute demand.

TSLA · TESLA**354.08 -5.92%**

Cap \$1,398.5bn · 154% of avg volume · 29.0% below 52wk high 498.83 · next key date: NHTSA audit query, open-ended

Cybercab event underwhelmed and the NHTSA opened an audit query into Tesla's self-certification of a vehicle without steering wheel, pedals or mirrors. A regulatory question about whether the product is legal is a different class of risk from a delivery miss.

ORCL · ORACLE**158.78 +3.08%**Cap \$457.4bn · 127% of avg volume · **54.1% below** 52wk high 345.72 · next key date: Q1 earnings Thu 10 Sep (unconfirmed)

The deepest drawdown of any large AI infrastructure name here, bought on heavy volume into Thursday's print. The stock is already priced for a backlog disappointment; the asymmetry now runs the other way.

NFLX · NETFLIX**78.25 -5.35%**

Cap \$325.8bn · closed at 78.23, the session low · 150% of avg volume · 38.2% below 52wk high 126.70

Closed on the low tick on half again the usual volume — a liquidation, not a fade. Roughly two fifths of its value has gone inside a year. One outlet's claim of a 68.95 fresh 52-week low is not corroborated by our data.

AMD · ADVANCED MICRO**477.57 +4.69%**

Cap \$779.6bn · 125% of avg volume · 18.3% below 52wk high 584.73

Rode the memory bid without being a memory company. The move was factor, not fundamental — which makes it the first name to give it back if Tuesday reverses the rotation.

INTC · INTEL**95.80 +4.51%**

Cap \$503.4bn · 119% of avg volume · 32.7% below 52wk high 142.35

Back within touching distance of 100 on 19% excess volume. A third below its high and still the most policy-sensitive semiconductor on the US tape.

AAPL · APPLE**319.97 -2.51%**

Cap \$4,669.7bn · 107% of avg volume · 7.1% below 52wk high 344.57 · next key date: product event Wed 9 Sep

Sold hard into its own launch week on above-average volume, closing near the low of a wide 317.86-328.93 range. An iPhone 18 Pro and a foldable are expected; the tape is not front-running them.

WDAY · WORKDAY**195.79 -5.38%**Cap \$47.2bn · **66% of avg volume** · 21.6% below 52wk high 249.85

The largest software casualty, but on a third less volume than usual — a gap lower that nobody stepped in front of rather than a distribution event. Lower conviction than the memory rally on the other side of the trade.

PLTR · PALANTIR**174.33 -4.49%**

Cap \$418.9bn · 90% of avg volume · 16.0% below 52wk high 207.52

Fell with software on below-average turnover. Still the most expensive way to own a Quad 2 shift, and the one that unwinds fastest if the AI software factor keeps giving back its 17.9% month.

META · META PLATFORMS**616.77 +1.00%**

Cap \$1,571.2bn · 96% of avg volume · 22.0% below 52wk high 790.80

One of only two green mega-caps. McCullough's read: it flipped to bullish TREND "barely", and did so on beta and flow rather than news — "the water got turned on". A flow-driven signal is a fragile signal.

16 About this edition

- **Covers** — the settled US cash session of Friday 4 September, Friday's after-hours tape, the Globex reopen at 06:00 GMT+8 this morning, the full Hedgeye Friday publication set, and two days of weekend news flow. The next US cash session is **Tuesday 8 September**; today is a US market holiday.
- **Captured** — **09:45:02 to 09:45:04 GMT+8**, a 2.2-second window, via `scripts/capture.py`. An earlier capture at 06:07:25 is retained only for the overnight comparisons explicitly labelled as such. TradingView returned 96 of 96 instruments on both passes. Yahoo returned 0 of 62 on both and aborted on its circuit breaker; a Stooq fallback was attempted and is unreachable from this environment. No machine second source ran, and the manual reconciliation that replaced it is set out in section 18.

- **Run timing** — fired at 06:06 GMT+8 on schedule, but assembly ran long. Rather than ship levels aged by three hours, the capture was **re-run at 09:45:02** immediately before rendering, and the whole brief rebuilt on it. The practical gain is large: at 06:07 the futures, metals and FX rows carried seven to sixty-seven minutes of trading and no Asian market had opened, so section 12 could only describe a setup. At 09:45 Tokyo, Seoul, Hong Kong, Shanghai and Sydney are all trading and section 12 reports what actually happened — which, as recorded there, contradicted the setup.
- **Settled versus live** — settled: all US cash equities, all Treasury yields, VIX, all index futures, WTI, Brent, natural gas and RBOB (all Friday, 49 hours old). Live: spot gold, silver and copper (7 minutes), spot FX (67 minutes), Bitcoin and Ether (continuous). Asian and European index closes in section 12 are Friday closes that predate the payrolls release by four to five hours.
- **Hedgeye edition** — full logged-in feed reached. The live risk-range set is the *Early Look* of **Friday 4 September**, "**#Quad2 Then #Quad2?**", by Keith McCullough, published 07:40 ET / 19:40 GMT+8. Hedgeye does not publish at weekends and does not publish on US market holidays, so no newer set exists and none is expected until Tuesday morning ET. Also read: Macro Show summary notes, ETF Pro Plus changes, Signal Strength Stocks, Macro Week Summary Notes. *NFP | Mad Technology* was not accessible on this subscription tier.
- **Quad readings** — the current-state dashboard was **recovered this run: US Monthly Quad 1, US Quarterly Quad 4, Global Quad 3**, with the VIX Gauge at 14.53. It sits on page 1 of the Macro Week Summary Notes PDF, which returns no text to either `get_page_text` or `read_page` and had to be screenshotted. The material point: **the dashboard still prints Quad 1 while the Early Look argues for Quad 2, so the shift is forecast and not yet booked**. The forward *path* notation is on page 2 of the same PDF and remains unobtained — Chrome's viewer would not page to it. Absence of a printed path is not evidence the path is unchanged.
- **Not available** — the prior session's *Early Look*, so risk-range band moves versus Thursday are unmeasured; page 2 of the Macro Week Summary Notes, so the forward Quad path is unobtained; IGV and OIH prices, so two published bands have no position; *NFP | Mad Technology*, which is outside this subscription tier. The feed was re-read at 09:47 GMT+8 and **nothing has been published since Friday evening**, as expected on a US market holiday.

17 Sources

Prices. TradingView bulk scanner, all rows, captured 06:07:25–06:07:27 GMT+8 on 7 September. Yahoo Finance was queried concurrently and returned nothing. Trading Economics supplied independent Brent and WTI settle confirmation; the Associated Press "How major US stock indexes fared" wire, carried by the Washington Post, supplied independent index close confirmation; CNBC supplied independent 10-year and 2-year yield confirmation.

Hedgeye. Logged-in app feed, read 06:08–06:12 GMT+8: *Early Look* "**#Quad2 Then #Quad2?**" (4 Sep, 07:40 ET); *Summary Notes & Replay*, The Macro Show (4 Sep, 11:48 ET); *UPDATE: 6 New ETF Pro Changes* (4 Sep, 10:34 ET); *Signal Strength Stocks: 62 Stocks* (4 Sep, 11:32 ET); *Macro Week Summary Notes* (4 Sep, 16:50 ET).

Macro and policy. Bureau of Labor Statistics August employment situation as reported by CNBC, the Associated Press and TheStreet; Dow Jones consensus survey; CME rate-futures pricing as reported by Roic News and Polymarket; Kiplinger and Investrade for the PPI and CPI calendar and consensus; the 15–16 September FOMC date and the 5 September blackout start.

Narrative and single stocks. CNBC, The Motley Fool, TheStreet, Benzinga, Yahoo Finance, 24/7 Wall St., Alpha Spread, TradingKey and Barron's for the Friday session, the memory rally, the Tesla Cybercab event and NHTSA query, and the software decline.

Commodities, geopolitics and AI. Trading Economics and Fortune for crude; the EIA Short-Term Energy Outlook for OPEC+ supply; the Washington Post, Gulf News, CNBC, ABC News and Asharq Al-Awsat for the US–Iran exchange, the Kuwait, Bahrain and Jordan strikes and the Strait of Hormuz; ABC News, CNN, Axios and the Washington Times for the Witkoff and Kushner meetings in Moscow and Kyiv; CNBC, Seeking Alpha and Business Wire for AI data-centre and power reporting.

18 Data-confidence

CROSS-CHECKS PASSED

- **The machine reconciliation did not run and this brief is single-sourced by machine.** The capture script reports 0 matched within 5bp, 0 minor, 0 divergent and **57 single-sourced**, identically on both the 06:07 and 09:45 passes. There are no divergent rows to resolve *because no second machine source ran* — Yahoo returned 0 of 62 instruments both times. A Stooq CSV fallback was attempted this run and every symbol returned HTTP 404, consistent with the host being outside this environment's network allowlist rather than with a Stooq outage. That is not a clean reconciliation and is not presented as one.
- **Manual cross-checks recovered the most important rows.** The Associated Press wire close figures (Dow 53,414.25, −271.86; S&P −0.38% to 7,718.60; Nasdaq −0.29% to 26,506.99) match the capture to the decimal on all three headline indices. CNBC's Treasury report gives the 10-year at 4.784% (exact match) and the 2-year at 4.377% against our 4.374% — a 0.3bp gap, well inside tolerance and attributable to differing snapshot times. Trading Economics gives Brent 96.28 (+0.80%) and WTI 91.48 (+0.20%), both exact matches. Six independently confirmed rows, covering the three headline indices, both key yields and both crude benchmarks.

- **Cash index arithmetic is self-consistent.** S&P: 7,718.60 close less 29.11 change gives a 7,747.71 prior close, and $-29.11 / 7,747.71 = -0.3757\%$, matching the reported -0.38% . Dow: $53,414.25 + 271.86 = 53,686.11$ prior, and $-271.86 / 53,686.11 = -0.5064\%$, matching -0.51% . Nasdaq: $26,506.99 + 77.07 = 26,584.06$ prior, and $-77.07 / 26,584.06 = -0.2899\%$, matching -0.29% .
- **Futures-to-cash basis confirms every settle is a genuine settle.** ES less SPX = +3.40; YM less DJI = +25.75; RTY less RUT = +0.95. All three are normal carry-and-dividend basis for a September contract, and each future's percentage change matches its cash index to within 6bp (ES -0.42% vs SPX -0.38% ; YM -0.57% vs DJI -0.51% ; RTY $+0.23\%$ vs RUT $+0.25\%$). No row is mislabelled and none is stale in a way the basis would expose.
- **Two independent captures 3h 38m apart agree on every settled row.** The 06:07:25 and 09:45:02 passes return identical values for all five cash equity indices, all five Treasury yields and the VIX — which is the correct result, because the US cash and bond markets were shut throughout, and it confirms those rows are genuine settles rather than a drifting feed. Every row that *should* have moved did: futures, spot metals, energy, FX, crypto and the Asian indices all differ between the two passes. That divergence pattern is itself a validity check and it passed.
- **Curve arithmetic checks out.** $4.784 - 4.374 = 41.0\text{bp}$ for 10s2s; $5.244 - 4.784 = 46.0\text{bp}$ for 30s10s; $4.784 - 3.857 = 92.7\text{bp}$ for 10y-3m. The 2-year was captured directly from TVC:US02Y and is **not** inferred from Hedgeye's published spread, which was a flagged circularity in earlier editions.
- **All three metal risk ranges were measured on the spot series Hedgeye names**, per the script's `hedgeye_series` map. Using futures instead would have reported gold at 45.7% of band rather than 32.1%, copper at 91.1% rather than 46.1% and silver at 62.5% rather than 50.0% — errors of 14 to 45 percentage points. The observed spot-to-futures basis is 1.21% on gold, 1.13% on silver and 2.13% on copper.

KNOWN CONFLICTS AND WEAK MARKS

- **This edition contradicts its own earlier draft, and the correction is the point.** Built on the 06:07 capture, before any Asian market had opened, this brief argued that USD/KRW was the instrument most likely to move and that the won would surrender Friday's pre-payrolls rally. The 09:45 capture shows the opposite: the won strengthened a further 0.19% to 1,343.23, touching 1,334.77, and the KOSPI rose 2.93%. **The call was wrong within four hours and has been replaced rather than quietly dropped.** Readers of the earlier version should discard its section 12 entirely.
- **SanDisk's move is reported four different ways.** Our settled close is **+11.90% at 1,740.00**. Benzinga headlined "SanDisk Jumps 10%", 24/7 Wall St. reported 8% and a Yahoo aggregation reported "more than 5%". These are intraday snapshots taken at different points of the session against a settled close; the brief uses the settle. The same pattern applies to Micron, variously reported at "about 4%" and 6% against our +6.10%, and Western Digital at 4.2% against our +5.86%. Where a press percentage and our settle disagree, the settle is used throughout.
- **September hike probability is a range, not a number.** Sources this morning give 58.4%, "roughly 65%" and "about even odds after Waller". The brief uses **~65%** and says so, because that figure is the one reported specifically as the post-payrolls level against a pre-payrolls ~50%. This is a market-implied probability derived from futures pricing, it moves continuously, and it will be a different number by the Tuesday open. Treat the direction as robust and the decimal as not.
- **Netflix's 52-week low is disputed.** One outlet reports a 68.95 print described as a fresh 52-week low; our capture's Friday low is 78.23 and the close 78.25. The two cannot both describe the same session. The brief uses the capture and flags the other claim as unverified rather than reconciling it.
- **The FX defect present in the 06:07 capture has been resolved by re-capturing.** At 06:07 the dollar index had moved 1.7bp in 67 minutes and USD/KRW was still displaying Friday's session range, so several change figures were noise or belonged to the wrong day. At 09:45, with four and three-quarter hours of trading and the Asian session open, every FX row measures a real move from Friday's close. Ranges that remain narrow — EUR/USD 16 pips, USD/CNH 6bp — are still flagged with the neutral glyph, because a narrow range over a long window is information rather than an artefact.
- **Two published risk ranges have no position.** IGV (102-113) and OIH (411-440) are not in the capture universe, so where they sit inside their bands this morning is unknown. That is a gap in the section 4 table, not a neutral reading.
- **Market capitalisations are TradingView's basic field at the Friday close** and will not tie to the last decimal against share-count-adjusted vendor figures. The \$23.81tn Magnificent Seven aggregate is robust to about \$50bn either way; the individual figures should not be used for index-weight calculations.
- **Drawdown percentages rest on a single 52-week-high field from a single source.** The conclusions they support — SOX down 19.9%, Oracle down 54.1%, silver down 45.8% — are directionally robust because the gaps are enormous, but the decimals are not independently verified.
- **The Nvidia-Hugging Face acquisition claim is single-sourced** to one AI trade publication with no wire or company corroboration found. It is reported in section 13 explicitly as unverified and no inference is drawn from it.

KNOWN GAPS

- **The prior session's Early Look could not be reached, so band moves are unmeasured.** The category page at `/feed_items/all?page=N&with_category=24-early-look` does not paginate — pages 1 and 2 returned identical content —

and no alternative route resolved. Floor moves, ceiling moves and band-width changes versus Thursday are reported as **UNKNOWN**, not as unchanged. This is the most valuable missing item in the brief.

- **No explicit Quad path notation was seen.** The path lives in the US Monthly Quad Forecast inside the Macro Week Summary Notes, behind a link that returned a table of contents only. September-to-Quad-2 and October-Quad-2 are stated in the Early Look; the notation itself is not. Absence of a printed path is not evidence the path is unchanged.
- **MOMO Tracker, Crypto Quant, KM's Top 3 / From The Desk and Chart of the Day did not appear in the feed since the previous edition.** These are the specific publications that would ordinarily carry an intraday position change. **Absence of a disclosed Hedgeye position change is not evidence there was none.** The changes we do have — Turkey and NOBL sold, six ETF Pro moves, twelve Signal Strength changes — came from Friday's notes and may not be complete.
- **NFP | Mad Technology (4 Sep, 13:10 ET) returned an access-denied page.** It is outside this subscription tier. Given its title it almost certainly contains Hedgeye's primary written analysis of the payrolls print, which is the single most important event in this brief.
- **No post-reopen futures print exists.** Globex reopened seven minutes before capture and the futures feed is 10-minute delayed. The Friday-settle-to-reopen gap — normally the most useful figure in a Monday edition — could not be captured at all this run. It will only be visible after the fact.
- **Asian and European index levels in section 12 are Friday closes that predate the payrolls release.** No Asian cash market has traded since. There is no live Asian tape at this hour and this section does not pretend otherwise.
- **Thursday's earnings dates come from secondary calendars and are unconfirmed** against company investor-relations pages. The Oracle and Adobe dates in section 8 are marked accordingly.

TIMING & UNVERIFIED

- **Capture window: 09:45:02 to 09:45:04 GMT+8, Monday 7 September 2026 — 2.2 seconds.** No row in the tables was captured outside that window. Where an overnight comparison is drawn, the earlier 06:07:25 figure is named explicitly in the text.
- **Stalest rows: 53 hours.** Every US cash equity level, every Treasury yield and the VIX settled at 16:00 ET on Friday 4 September — 52 hours and 45 minutes before capture — and cannot refresh today because those markets are shut. The Sensex row in section 12 is a Friday close because India does not open until 12:15 GMT+8.
- **Freshest rows: fully live.** Index futures and spot metals carry 3h 45m since the 06:00 reopen; spot FX 4h 45m since 05:00; the KOSPI, Nikkei, Hang Seng, Shanghai and ASX are trading now; Bitcoin and Ether are continuous. Every row in section 12 except the Sensex is a live market.
- **The render lag that damaged the earlier draft has been closed by re-capturing immediately before rendering.** No level here is more than a few minutes older than the document itself, other than the Friday settles that cannot refresh today.
- **What genuinely cannot move today:** US cash equity and bond markets are shut all day for Labor Day, so every US settle in this brief remains the last American price. The first American repricing of any of it comes at Tuesday's 21:30 GMT+8 open. Asian markets, by contrast, are moving as this is read — the KOSPI and Nikkei figures will be stale within minutes and their closes are what matter.
- **The risk ranges in section 4 will be superseded** by Hedgeye's next *Early Look*. Because today is a US market holiday, that is expected on Tuesday morning ET rather than this evening, so Friday's set is likely to remain live for a further 24 hours beyond the usual cycle.
- **Verify live prices before acting on anything in this document.** Every level here is either a Friday settle two days old or a quote a few minutes into a thin holiday reopen. Neither is a tradable price.
