

Daily Need to Know

Tuesday, 1 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — SETTLED 16:00 ET MON 31 AUG, ROUGHLY TWO HOURS BEFORE CAPTURE			
S&P 500	7,686.14	−25.62 / −0.33%	Opened at the day's high (7,697.52), fell to 7,665.06, closed at 65% of a narrow 32-point range. 1.67% below the 52-week high. Volume 3.44bn vs a 2.72bn ten-day average — month-end and index-review flow, not conviction.
Nasdaq Composite	26,370.89	−31.53 / −0.12%	Closed at 82% of its range — the strongest close of the four. Mega-cap tech absorbed the geopolitical hit that the Dow could not.
Dow Jones Industrial	53,185.90	−374.09 / −0.70%	Also opened at its high and closed at 18% of range — the bottom fifth. Alphabet and Goldman Sachs the two named drags. Worst of the majors.
Russell 2000	2,956.45	−15.92 / −0.54%	Sits at 8.0% of Hedgeye's 2,950–3,031 band — all but on the floor. Up 0.12% over the last month against the Nasdaq's 4.07%.
PHLX Semiconductor	11,535.06	+65.40 / +0.57%	The only major equity gauge up. Still −1.54% over one month despite being +58.26% year to date — the AI trade paused in August.
US INDEX FUTURES — MONDAY'S GLOBEX SESSION, SETTLED 17:00 ET; NEW SESSION SIX MINUTES OLD AT CAPTURE			
E-mini S&P (ES)	7,699.00	−23.00 / −0.30%	Monday session on 1,174,219 lots, range 7,674.75–7,724.00. Basis to cash +12.86, normal carry — confirms the settle is a settle. Reopen print 06:12 GMT+8: 7,702.25 on 625 lots .
E-mini Nasdaq (NQ)	29,513.00	+21.25 / +0.07%	The only green future. 456,647 lots. Reopen 29,514.00 on 470 lots — five minutes of trade carrying no information.
E-mini Dow (YM)	53,240.00	−344.00 / −0.64%	55,501 lots. Reopen 53,268 on 26 lots.
E-mini Russell (RTY)	2,958.70	−18.80 / −0.63%	176,426 lots. Reopen 2,958.80 on 79 lots.
US TREASURY CASH YIELDS — MONDAY'S SESSION			
10-year	4.754%	+2.4bp	Closed above the top of Hedgeye's 4.63–4.74 band — the only instrument in the risk-range table outside its range. Friday's 4.73% close reconciles exactly.
30-year	5.247%	+3.4bp	The day's biggest yield move. 30s10s widened 1.0bp to 49.3bp.
5-year	4.504%	+1.3bp	Belly moved less than the long end — a term-premium move, not a policy move.
2-year	4.346%	−1.4bp	The only yield to fall. 10s2s steepened 3.8bp to 40.8bp — the session after Hedgeye reported selling its curve steepener.
13-week bill	3.837%	+1.5bp	Front end anchored; no policy repricing in the bill.
ENERGY — MONDAY'S GLOBEX SESSION; FRONT-MONTH CONTINUOUS CONTRACTS			
WTI crude	\$85.76	+2.36 / +2.83%	Range 84.11–86.79. Broke and held above the \$83 level Hedgeye names as both its trade and trend line. Up 50.43% year to date — the largest move in any major asset class this year.
Brent crude	\$90.49	+2.39 / +2.71%	Settled above \$90 for the first time in the recent range. Range 89.03–91.50.
Natural gas	\$2.935	+0.047 / +1.63%	At 86.5% of a 2.71–2.97 band Hedgeye marks neutral TREND — pressed against the ceiling without a trend signal behind it.
RBOB gasoline	\$3.0770	+0.0268 / +0.88%	Lagged crude badly — a third of WTI's move. The crack narrowed; this is a crude-supply scare, not a demand story.
METALS — SPOT SERIES, THE ONES HEDGEYE'S BANDS NAME; SPOT SESSIONS ROLLED AT 17:00 ET			
Gold (spot)	\$4,453.00	+0.11% (6 min)	The change is six minutes old and is noise. The session that matters: gold futures −1.07% to \$4,481.50 . Spot sits at 23.1% of the 4,378–4,703 band, +8.52% over one month.
Silver (spot)	\$66.58	+0.15% (6 min)	Again noise. Silver futures settled −1.17% at \$66.99. Spot at 31.6% of a 65–70 band.
Copper (spot)	\$6.5609	+0.06% (6 min)	Six-minute range of half a cent. Copper futures settled +0.43% at \$6.6875. Spot at 37.4% of the 6.46–6.73 band — measured on futures it would read 84.3%, which is the whole reason the spot discipline exists.

ASSET	LAST	CHANGE	NOTE
CURRENCIES, VOLATILITY AND CRYPTO			
Dollar index (DXY)	99.413	−0.264 / −0.26%	Gave back part of Friday's +0.9% week. At 63.1% of a 98.70–99.83 band Hedgeye marks bullish TRADE, bearish TREND. Range 99.39–99.71 indicates a full session, not a fresh one.
USD/JPY	159.76	+0.02% (6 min)	Seven-pip range since the 17:00 ET roll — Monday's move is not in this figure. Hedgeye moved the yen back to neutral TREND after a −0.6% week.
USD/KRW	1,366.80	−11.59 / −0.84%	A genuine full Asian session, range 1,365.68–1,378.32. Won at its strongest after the Bank of Korea raised rates — tightening into a slowdown, and a headwind for Korean exporters.
VIX	14.93	+0.51 / +3.54%	Rose on a −0.33% S&P day. Still at 36.2% of a 14.06–16.46 band and well inside what Hedgeye calls the investable bucket. Complacent, not calm.
Bitcoin	\$78,969.51	+1,252.71 / +1.61%	The only genuinely live row in this table — 22 hours of a UTC day. Range 77,387–79,246. +25.60% over one month and still −9.86% year to date.

▲ up · ▼ down · ♦ unchanged or immaterial. Cash equities are settled closes. Futures, spot metals and most FX majors rolled to a new session at 17:00–18:00 ET, minutes before capture; where a change figure covers only those minutes it is labelled and should be read as noise, not as a move. Reconciliation of the two capture sources is in section 18.

TL;DR

The US struck Iranian rocket launchers on the Strait of Hormuz on Sunday and the tape spent Monday pricing it. Brent settled above \$90, WTI above \$85, energy rose 2.04% and **ten of the eleven S&P sectors fell**. One factor moved everything.

The bond market did not read it as a growth scare. Thirty-year yields rose 3.4bp, the ten-year closed above the top of its risk range at 4.754%, and the two-year fell. That is an inflation trade, not a flight to quality — and the curve steepened 3.8bp the session after Hedgeye sold its steepener.

The S&P settled 8.86 points below the 7,695 dealer-gamma flip level cited in Monday's gamma reporting. If that level is right, dealers stop damping the range and start amplifying it. It is a single-source level and the decimal deserves scepticism, but the direction of the crossing does not.

Breadth is the tell nobody led with. The Russell 2000 sits at 8.0% of its risk range and the equal-weight S&P at 7.8% — both effectively on the floor — while the Nasdaq sits at 70.3%. The broadening trade that carried July and August is over; Hedgeye said on Monday it had sold it.

And Chicago PMI printed 47.1 against 57.8 expected — a 10.5-point miss into contraction, on the same day the Dallas Fed survey jumped from 1.3 to 11.6. Two regional surveys, opposite directions, same month.

2 The big picture — what it means

1. This was a one-factor session and the factor was crude. Energy rose 2.04%; the other ten S&P sectors fell, in a band from −0.36% to −1.35%. When a single sector is the only survivor and the rest cluster tightly negative, the market is not making a judgement about earnings or growth — it is repricing one input. The input was the first US military action near the Strait of Hormuz in a month, and roughly a fifth of the world's seaborne oil passes through it.

2. The rates market called it inflation, not risk-off. A genuine geopolitical fear trade bids Treasuries. This did the opposite: thirty-year yields rose 3.4bp, ten-year 2.4bp, and only the two-year fell, by 1.4bp. Long-end yields rising while the front end anchors is a term-premium and inflation-expectations move. It is also precisely the setup Hedgeye labels Quad 3 — growth slowing, inflation reaccelerating — and Monday's tape delivered it in near-textbook form.

3. The curve steepened on the day Hedgeye's steepener was already gone. 10s2s widened 3.8bp to 40.8bp. Keith McCullough wrote on Monday morning that he had sold the curve steepener because last week's move compressed the curve by 12bp. Within hours the compression reversed. One session is not a verdict on the call — the position was sold on a trend signal, not a one-day forecast — but it is the inconvenient number and it belongs in the record.

4. Breadth has quietly died while the index has not. Over the last month the Nasdaq Composite gained 4.07%, the S&P 3.00%, the Dow 1.82% and the Russell 2000 **0.12%**. Equal-weight gained 1.85%. The index level is 1.67% from a record; the average stock inside it has gone nowhere for four weeks. Hedgeye's risk ranges say the same thing more sharply: the Nasdaq sits at 70% of its band, the Russell at 8% and equal-weight at 8%.

5. The semiconductor complex is up 58% this year and down 1.5% this month. The SOX rose 0.57% on Monday and was the only green major index, but it has lagged over four weeks while hyperscaler capex headlines have grown larger, not smaller. Nvidia rose 1.48% to a \$5.32 trillion capitalisation and is the largest company in the world by some margin. Both facts are true; the second is why the first stopped mattering to the index.

6. Two of the Magnificent Seven are the year's problem. Tesla is down 19.63% year to date and Meta 13.64%, against an S&P up 11.75%. Tesla rose 5.51% on Monday on a Nevada robotaxi approval and anticipation of its 3

September Cybercab event — a 5.5% day that still leaves it a fifth lower on the year. Alphabet fell 2.09% and was the single largest drag on both the S&P and the Nasdaq, extending a de-rating that Bloomberg put at \$692 billion of market value on 27 August.

7. The month closed higher and almost nobody will lead with why that is fragile. August was the S&P's first monthly gain since May. It was also a month in which utilities fell 6.1%, industrials 2.98% and real estate 2.58%, and in which the entire index advance came from five sectors. September's reputation is the worst month of the year; the more useful statistic is that when August finishes positive with the year up between 10% and 17.5% — the S&P is up 11.75% — September has averaged a 1.0% gain since the First World War. That is a thin base of observations carrying a lot of narrative weight.

3 Rates, currencies & commodities

- **The ten-year broke its range.** At 4.754% it closed 1.4bp above the top of Hedgeye's 4.63–4.74 band — the only instrument in the entire risk-range table trading outside its range. Friday's 4.73% close reconciles to the basis point, so the breakout is real rather than a data artefact.
- **Bond volatility turned up hard.** The MOVE index rose 6.14% to 75.32 from 70.97, crossing back above the 75 handle that Hedgeye has used as a marker for contained rate vol. A 6% one-day move in bond vol on a 2.4bp yield move is disproportionate and worth watching more than the yield itself.
- **The dollar gave back a quarter of a per cent** to 99.413 after ending last week up 0.9% and moving, in Hedgeye's framework, to bullish TRADE while remaining bearish TREND. It sits at 63.1% of its band — nearer the ceiling than the floor, with the trend signal pointing the other way. That tension is unresolved.
- **The won was the FX story and it is a semiconductor story.** USD/KRW fell 0.84% to 1,366.80 across a full Asian session after the Bank of Korea raised rates — tightening into a slowdown. Hedgeye records the won up 6.5% against the dollar in a month. A rapidly appreciating currency is a direct margin headwind for Korean memory and logic exporters, and Korea is where the US semiconductor tape takes its cue.
- **Crude broke a level that Hedgeye had flagged in advance.** WTI's trade and trend lines both sit near \$83; above it, the contract added more than 3% intraday before settling +2.83% at \$85.76. Brent settled +2.71% at \$90.49. Gasoline rose only 0.88% — the crack narrowed, which marks this as a supply-risk premium rather than demand.
- **Precious metals fell while the inflation trade rose.** Gold futures settled –1.07% and silver –1.17%, continuing the correction Hedgeye attributes to the dollar's inverse correlation; McCullough wrote that gold corrected 3.2% last week and held bullish TRADE and TREND, and told Monday's Macro Show audience he was buying it. Copper futures rose 0.43%, extending a run he puts at +4.7% over a month.
- **The softs are where the inflation is most visible.** Hedgeye records cocoa +10.2% last week and +18.3% in a month, and corn +5.5% and +11.7%. Wheat futures fell 1.28% on Monday to 774, giving back a slice of a large prior week. None of this is in core CPI yet; all of it is in the commodity complex now.

4 Hedgeye — regime, risk ranges & the Quad path

MACRO DASHBOARD

ITEM	READING	NOTE
Current Quad	Quad 3 — growth slowing, inflation accelerating	Title of Monday's Early Look: "Fed Hawkish In #Quad3".
Quad path	3 → 1 → 2	Printed explicitly as "the pending Quad Count of 3-1-2" in the Macro Show deck; September is named as Quad 1. Unchanged from the prior edition.
Equity vol regime	Investable	VIX 14.93, under the 19 threshold; dealer gamma positive per Tier1 Alpha as cited by Hedgeye.
Curve steepener	Sold (IVOL)	Exited before Monday. The curve then steepened 3.8bp.
Broadening trade	Sold	Held from the July lows to the August highs, particularly health care; closed on Monday.
Bonds	Short (TLT, ZROZ)	Both ends of the curve bullish TREND from a yield perspective.
Bond vol (MOVE)	75.32, +6.14%	Back above the 75 marker.
KOSPI "Alpha Code"	69 / 72 — trade ≈6,910, trend ≈7,200	KOSPI closed 6,820.03, roughly 1.3% below the stated trade line. Described as the tip of the spear for US semis.
Oil "Alpha Code"	83 / 83	WTI settled \$85.76, comfortably through both.

RISK RANGE™ SIGNALS — EARLY LOOK, 31 AUGUST, 19:43 GMT+8

INSTRUMENT	IMMEDIATE-TERM RANGE	TREND	WHERE IT STANDS NOW
10-yr UST yield	4.63 – 4.74	bullish	4.754 — outside, above the ceiling by 1.4bp. The only breakout in the table.
High Yield (HYG)	79.45 – 79.99	bullish	79.81 — 66.7% of band, upper half. Credit is not confirming the equity wobble.
Inv. Grade (LQD)	105.5 – 106.9	bearish	106.21 — 50.7%, mid-band. Bearish TREND with price dead centre.
S&P 500	7,625 – 7,749	bullish	7,686.14 — 49.3%, almost exactly mid-band. 63 points of downside to the floor, 63 of upside.
Nasdaq Composite	25,848 – 26,592	bullish	26,370.89 — 70.3%, upper third. The strongest-positioned US equity gauge.
Russell 2000	2,950 – 3,031	bullish	2,956.45 — 8.0%, on the floor. 6.45 points from breaking the range.
Health Care (XLV)	168 – 178	bullish	170.54 — 25.4%, lower third, despite being a favoured long. +5.07% over one month.
Equal Weight (RSP)	219.00 – 224.00	bullish	219.39 — 7.8%, on the floor. The breadth proxy and the small-cap proxy agree.
Tech Software (IGV)	103.00 – 112.00	bullish	Not captured this run — see KNOWN GAPS. Position within band unknown.
Shanghai Composite	3,882 – 4,016	neutral	3,986.30 — 77.8%, upper third after a +0.86% Monday. Bullish TRADE, not owned.
Nikkei 225	64,848 – 67,302	bullish	66,311.71 — 59.6%, mid-upper. Fell 0.14% Monday.
German DAX	26,008 – 26,589	bullish	26,258.11 — 43.0% after a –1.17% session. Europe took the geopolitical hit harder than the US.
VIX	14.06 – 16.46	bearish	14.93 — 36.2%, lower third. Bearish TREND on vol is a bullish signal on equities.
US Dollar Index	98.70 – 99.83	bearish	99.413 — 63.1%, upper half against a bearish trend signal.
WTI crude (continuous)	82.10 – 88.59	bullish	85.76 — 56.4%. A 2.83% day moved it only to mid-band; the band is 7.9% wide.
Nat gas (continuous)	2.71 – 2.97	neutral	2.935 — 86.5%, pressed to the ceiling with no trend signal supporting it.
Gold (spot)	4,378 – 4,703	bullish	4,453.00 — 23.1%, lower third after the futures correction. On futures this would misread as 31.8%.
Copper (spot)	6.46 – 6.73	bullish	6.5609 — 37.4%. On futures this would misread as 84.3% — a 46.9-point error, and the clearest case for the spot discipline.
Silver (spot)	65 – 70	bullish	66.5822 — 31.6%, lower third. On futures, 39.8%.

Band positions computed on the series Hedgeye names: spot for gold, silver and copper; continuous front-month contracts for crude and natural gas. **Band moves versus the prior session's Early Look are UNKNOWN** — the Friday 28 August note could not be reached this morning; the Early Look category page does not paginate and the unfiltered feed returned the same top item on page 3. Absence of a reported move is not evidence the bands were unchanged.

WHAT KEITH ACTUALLY SAID

"US Dollar Index ended +0.9% higher on the week and moved to Bullish TRADE, Bearish TREND" · "Gold corrected -3.2% on its obvious INVERSE USD Correlation, but held onto Bullish TRADE and TREND"

Keith McCullough, Early Look "Fed Hawkish In #Quad3", 31 August 2026, 19:43 GMT+8 (07:43 EDT)

"UST 2yr Yield popped a big +12 basis points last week and remains Bullish TREND" · "Yield Curve compressed by -12 basis points in kind" · "That's why I sold The Fam's Curve Steepener (IVOL) before it got smoked."

Same publication

"Dr. Copper inflated another +1.1% last week to +4.7% in the last month alone" · "Cocoa inflated another +10.2% last week to +18.3% in the last month alone" · "XLU is down -6.1% in the last month alone, leading losers in what was a great month for winners"

Same publication

"South Korean Won was up another +1.0% vs. USD last week to +6.5% in the last month alone" — and, on Korea's central bank: "unlike USA, they're just going ahead with RATE HIKES. They're TIGHTENING into a #Quad4 Slowdown!"

Same publication

From The Macro Show, 31 August, 22:33 GMT+8 — reported as attributed summary, not quotation. Hedgeye's published summary notes carry an explicit warning that they have been enhanced by AI and may contain errors, so the wording below is not treated as verbatim. McCullough described rates as the lead signal and said he was short bonds through TLT and ZROZ; said oil's move above its \$83 signal level was causal rather than surprising; disclosed buying Physical Uranium (SRUUF) on Friday and holding Lumber via WOOD and Oil Services via OIH; said the broadening trade had been sold because the S&P's risk range had produced two days of lower highs; maintained long health care against short utilities, and long high yield into September's Quad 1; described the Microsoft pivot from short to long as one of the better calls made, with Apple still bullish trade and trend; framed US semiconductors through the Korean signal; said China is back to bullish TRADE but is not owned and is not shorted, with KWEB bearish and KBA the preferred A-share vehicle; reported being stopped out of a long yen position and

having covered the dollar short while adding to gold, Canadian dollars and euros, ranked gold first by size; and said Bitcoin and Ethereum both remain bullish trade and trend, with Ethereum the first he would buy after its correction.

OTHER HEDGEYE PUBLICATIONS SINCE THE PREVIOUS EDITION

- **ETF Pro Plus, 22:34 GMT+8** — one change: removing the short in EM Infrastructure (EMIF), range 25.21–26.44. A short removal in their framework means the position has broken TRADE and/or TREND and shorts should cover.
- **Signal Strength Stocks, 23:34 GMT+8** — 79 stocks, 7 added and 7 removed. Additions: SPGI, FCFS, CACC, MCO, GTBIF, FIVN, BRCB. Two ratings agencies and three consumer-credit names entering a momentum screen on the same day is itself a signal about where the factor is rotating.
- **Capital Allocation Pro, 1 September 00:21 GMT+8** — model portfolio changes effective on Monday's closing prices. **The changes themselves are published as an image and a gated PDF and could not be read.** Trend and Tail levels for 68 ETFs were refreshed on Friday 28 August closes; BNO and USO were added to coverage and MBB and PFF removed.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Nvidia (NVDA)	220.78	+1.48%	\$5.32tn	Largest company in the world. +11.26% over one month, +16.30% YTD. Held the tape up while the Dow fell.
Apple (AAPL)	316.85	−0.89%	\$4.62tn	Still bullish trade and trend in Hedgeye's framework. +3.95% over one month.
Alphabet (GOOGL)	339.35	−2.09%	\$4.13tn	Largest single drag on both the S&P and Nasdaq. −0.43% over one month; the only Mag7 name lower on the month besides Amazon.
Microsoft (MSFT)	507.29	−1.22%	\$3.77tn	+12.73% over one month — the best of the seven — and only +4.73% YTD. The pivot from short to long has worked.
Amazon (AMZN)	259.77	−2.50%	\$2.80tn	Worst Mag7 performer on the day. −1.97% over one month, despite being flagged as Friday's best place to have money.
Meta (META)	572.34	−0.98%	\$1.46tn	−13.64% YTD, 27.6% below its 52-week high of 790.80. +5.29% over one month is a bounce, not a repair.
Tesla (TSLA)	367.95	+5.51%	\$1.45tn	Nevada robotaxi approval plus the 3 September Cybercab event. +18.81% over one month and still −19.63% YTD.

Combined capitalisation \$23.56tn. Two of the seven — Tesla and Meta — are down double digits on the year while the index is up 11.75%.

6 Positioning & options

- **The S&P closed below the gamma flip.** Monday's gamma reporting placed the S&P flip level at **7,695**, with spot intraday at 7,712 and dealers in positive gamma, buying dips and selling rips. The index then settled at **7,686.14** — 8.86 points below it. Above the flip, dealer hedging compresses the range; below it, hedging extends the range. This is a single-source estimate and providers disagree on flip levels by tens of points, so treat the number as indicative and the crossing as the signal.
- **Hedgeye's read is the opposite of alarmed**, and both can be true. VIX under 19 keeps US equity vol in what they call the investable bucket, and they cite Tier1 Alpha for positive dealer gamma. Their conclusion from the S&P's two consecutive lower highs is consolidation of gains, not a bearish trend breakdown.
- **Positioning is complacent by its own measures.** The put/call ratio is reported below 0.75 and the VIX below 15. Neither is at an extreme, but neither is carrying any hedge against a conflict that reopened on Sunday after a month of quiet.
- **Volume was heavy and it was mechanical.** S&P volume of 3.44bn ran 26.3% above the ten-day average. Month-end rebalancing and an MSCI index review that took effect at Monday's close explain the bulk of it. Do not read conviction into the print.
- **Vol rose on a small down day.** The VIX gained 3.54% while the S&P fell 0.33% — a larger vol response than the move warranted, and the kind of asymmetry that usually reflects demand for protection rather than realised movement.
- **Bond vol moved more than equity vol.** MOVE +6.14% against VIX +3.54%. The market that repriced hardest on Monday was rates, not equities, and that has been the pattern all month.

7 Sector rotation — leaders & laggards

SECTOR (SPDR)	LAST	DAY	1 MONTH	YTD
Energy (XLE)	63.96	+2.04%	+8.54%	+43.02%
Technology (XLK)	186.50	+0.44%	+5.09%	+28.06%
Health Care (XLV)	170.54	−0.36%	+5.07%	+10.12%

SECTOR (SPDR)	LAST	DAY	1 MONTH	YTD
Cons. Discretionary (XLY)	116.59	−0.53%	+1.00%	−2.91%
Cons. Staples (XLP)	84.98	−0.55%	+0.15%	+9.36%
Financials (XLF)	57.71	−0.67%	+1.58%	+5.25%
Real Estate (XLRE)	44.11	−0.83%	−2.58%	+9.35%
Materials (XLB)	52.69	−0.92%	+3.50%	+15.75%
Industrials (XLI)	175.13	−1.13%	−2.98%	+12.54%
Utilities (XLU)	42.23	−1.17%	−5.34%	−1.54%
Communications (XLC)	111.46	−1.35%	+4.34%	−5.67%

- **Leaders.** Energy alone, and by a distance — 2.04% against a next-best of 0.44%. Its 43.02% year-to-date gain is second only to semiconductors among anything widely held, and it is the sector Hedgeye is expressing through oil services rather than the commodity.
- **Laggards.** Communications −1.35%, dragged by Alphabet's 2.09% fall; industrials −1.13% on higher energy input costs; utilities −1.17%, extending the month's 5.34% decline. Utilities are the cleanest Quad 3 short there is — a bond proxy in a rising-long-yield regime — and Hedgeye is short them explicitly.
- **Rotation.** The month's map is the regime map: energy +8.54%, technology +5.09% and health care +5.07% on one side; utilities −5.34%, industrials −2.98% and real estate −2.58% on the other. Rate-sensitives are being sold, inflation beneficiaries bought. Communications is the anomaly — up 4.34% on the month and down 5.67% on the year, which is a single-stock story wearing a sector label.

8 Forward — futures & the week ahead

The overnight tape barely exists. Globex reopened at 18:00 ET, six minutes before capture, and by 06:12 GMT+8 the S&P contract had traded **625 lots** against Monday's 1.17 million. The reopen prints — ES 7,702.25, NQ 29,514.00, YM 53,268, RTY 2,958.80 — are all within a few points of Monday's settles and carry no information whatsoever. Crude continued to firm in the thin session, with WTI printing 86.29 against an 85.76 settle, which is the only overnight move with a plausible cause behind it. Everything else in this brief that is labelled live is, in practice, Monday's settle plus a handful of minutes.

DAY (GMT+8)	KEY EVENTS
Tue 1 Sep	Asian manufacturing PMIs through the morning. US ISM Manufacturing (Aug) 22:00 — the read that matters after Chicago PMI's collapse to 47.1. ISM prices-paid consensus reported at 71.2 against 71.1 prior (<i>secondary calendar, unconfirmed</i>). S&P Global US manufacturing PMI final 21:45; construction spending 22:00.
Wed 2 Sep	ADP private employment (Aug); JOLTS job openings (<i>date unconfirmed — secondary calendars place it Tuesday or Wednesday</i>). First read on labour demand ahead of Friday.
Thu 3 Sep	US ISM Services (Aug); weekly jobless claims. Tesla Cybercab event — the catalyst behind Monday's 5.51% move.
Fri 4 Sep	US Employment Situation, August — 20:30 GMT+8 (08:30 ET). Confirmed against the BLS release schedule. The week's only genuinely binary event.
Mon 7 Sep	US Labor Day — US markets closed. Note that this is the seventh, not the first: the holiday falls late this year and last week was a full trading week.

Consensus figures other than the BLS date are drawn from secondary calendars and are marked unconfirmed. Hedgeye publishes its next Early Look at approximately 19:40 GMT+8 today, which will supersede every risk range in section 4.

9 Corporate news

- **Tesla +5.51% to \$367.95.** Nevada's Transportation Authority approved Tesla Robotaxi as an autonomous vehicle network company in Clark County, authorising up to 5,000 fully autonomous vehicles in the first twelve months after the permit is issued. The Cybercab — no steering wheel, no brake pedal — is slated for public launch in Austin, with an event on 3 September. The stock remains 19.63% lower on the year and 26.2% below its 52-week high.
- **SanDisk +5.50% to \$1,566.70,** reversing an intraday loss of more than 2%. MSCI's August quarterly index review, announced on 12 August, added the stock to its Global Index effective after Monday's close — which also helps explain the session's volume. Capitalisation \$229.4bn against a 52-week low of \$50.07, which is the more remarkable number on the line.
- **Alphabet −2.09% to \$339.35** and the single largest drag on both headline indices. This extends the de-rating Bloomberg quantified at \$692bn of lost market value on 27 August, attributed to AI product delays and departures of technical staff. The stock is down 0.43% over one month while the Nasdaq is up 4.07%.
- **Goldman Sachs down roughly 1%** and the second named drag on the Dow. A 374-point Dow decline led by a bank and an advertising-and-search business is not a geopolitical risk trade; it is idiosyncratic weight in a price-weighted index.

- **Workday –3.55% to \$197.45**, still de-rating after its 27 August results. Subscription revenue backlog reached \$27.4bn, up 8%, against roughly \$28.6bn expected. AI accounted for more than a quarter of new contract value, and guidance merely in line was not enough to hold the stock.
- **Memory diverged.** Micron +2.77% and SanDisk +5.50% against Western Digital –1.94%. The complex has traded together since mid-August on flagged memory bottlenecks; Monday broke the correlation, and the index-review flow in SanDisk is the most likely reason.
- **Intel closed +0.04% at \$89.51 after trading a 3.2% range** (88.97–91.85) on 65.0m shares. A stock that gives back a 2.6% intraday gain to close unchanged has told you something; a stock that does it on a 52-week low of \$23.68 has told you more.

10 Macro data

- **Chicago PMI (August): 47.1 actual against 57.8 consensus, 57.6 prior.** A 10.5-point single-month collapse from expansion into contraction, and a 10.7-point miss against consensus. On any normal day this is the story. It landed on a day the market was pricing a military strike, and it was almost entirely ignored.
- **Dallas Fed Manufacturing (August): 11.6 actual against 1.3 prior.** A 10.3-point improvement, deeper into expansion. Two regional manufacturing surveys covering the same month moved 10 points in opposite directions.
- **The two cannot both be describing the same economy**, and the honest reading is that neither is reliable in isolation. Chicago's survey has a documented history of large single-month swings and a heavy weighting toward a small number of respondents. What the pair does establish is that Tuesday's ISM manufacturing print carries far more weight than it did on Friday.
- **The read-through to the regime call is genuinely two-sided.** Chicago PMI at 47.1 supports the growth-slowng half of Quad 3 emphatically. Dallas at 11.6 does not. Hedgeye's Quad 3 label rests on inflation accelerating as well as growth slowing, and Monday's commodity tape supported the inflation half without qualification.
- **Nothing scheduled for Monday changed the rate path.** The two-year fell 1.4bp on a day with a manufacturing survey in contraction and crude up 2.83% — those two pull the front end in opposite directions and the result was close to a wash.

11 Geopolitics

- **▲ US forces struck Iranian rocket launchers on the Strait of Hormuz on Sunday 30 August**, the first US military action in the region in a month. US Central Command, through spokesperson Captain Tim Hawkins, said Islamic Revolutionary Guard Corps forces were preparing to launch rockets carrying sea mines into the strait. That characterisation of intent is CENTCOM's account and has not been independently confirmed.
- **◆ Iranian semi-official outlets reported explosions near Larak Island** in the strait. Iran vowed to retaliate for what it described as a deadly attack. Casualty claims are Iran's and are not independently verified.
- **▲ Roughly 20% of the world's seaborne oil transits the Strait of Hormuz.** Mining it is the one action that converts a regional conflict into a global energy event, which is why an exchange of fire involving a handful of launchers repriced crude by nearly 3% and moved every equity sector.
- **◆ This sits inside an intermittent conflict now running more than six months**, with the preceding month quiet. Markets had visibly stopped pricing it: the VIX entered Monday under 15 and crude entered the week near \$83. A month of quiet had been treated as resolution.
- **▼ The market's response was contained and that is the risk.** Brent added 2.71% and the S&P lost 0.33%. If the strait is genuinely at risk of mining, neither number is large. If it is not, crude has already priced an event that will not happen. The asymmetry is unattractive in both directions and there is no hedge in positioning.

12 Overnight setup — what Asia opens into

INSTRUMENT	LEVEL	CHANGE	SESSION STATUS
ES (E-mini S&P)	7,702.25	+3.25 vs settle	New session, 625 lots. Monday settle 7,699.00 on 1,174,219 lots.
NQ (E-mini Nasdaq)	29,514.00	+1.00	470 lots against Monday's 456,647.
YM (E-mini Dow)	53,268	+28	26 lots against Monday's 55,501.
RTY (E-mini Russell)	2,958.80	+0.10	79 lots against Monday's 176,426.
USD/JPY	159.76	+0.02%	Six minutes, seven-pip range. Not a move.
USD/KRW	1,366.80	–0.84%	Full Monday Asian session. Won at its strongest.
USD/TWD	31.71	+0.16%	Full Monday Asian session. Taiwan dollar softer against a stronger won.
USD/CNH	6.7179	+0.00%	Six minutes. Monday's move not captured.

INSTRUMENT	LEVEL	CHANGE	SESSION STATUS
EUR/USD	1.1617	+0.00%	Six minutes, five-pip range.
Gold / Silver (spot)	4,453.00 / 66.58	+0.11% / +0.15%	Six minutes. Monday: futures -1.07% and -1.17%.
Copper (spot)	6.5609	+0.06%	Six minutes. Monday: futures +0.43%.
WTI / Brent	86.29 / 90.49	+0.62% / +2.71%	WTI is the one instrument genuinely extending overnight. Brent shown at Monday's settle.
Bitcoin / Ether	78,969 / 2,477.13	+1.61% / +2.43%	Genuinely live. 22 hours of a UTC day. The only rows in this table with real information.

Previous Asian closes, Monday 31 August, marked as such: Nikkei 225 **66,311.71 (-0.14%)**; Hang Seng **25,566.99 (-0.07%)**; KOSPI **6,820.03 (+0.46%)**; Shanghai Composite **3,986.30 (+0.86%)**; ASX 200 **9,076.00 (-0.18%)**; Sensex **76,957.27 (-0.40%)**. Europe Monday: DAX -1.17%, CAC -0.79%, STOXX 50 -1.01%, FTSE 100 +0.29%.

- **The US hands Asia one sector and one story.** Energy up 2.04%, everything else down. Asian energy and shipping names should open bid; Japanese and Korean refiners and airlines face the other side of an \$86 crude print.
- **Korea is the instrument most likely to move.** The KOSPI closed at 6,820.03, roughly 1.3% below the 6,910 level Hedgeye names as its trade line, and the won is at its strongest in a month after a Bank of Korea rate rise. A strengthening currency and a semiconductor index that has gone nowhere for four weeks are a poor combination for an export tape — and Hedgeye treats the KOSPI as the leading signal for US semis, which means Tuesday's Seoul session is a read on Wednesday's Philadelphia one.
- **Japan opens into a yen it cannot read.** USD/JPY at 159.76 has six minutes of trade behind it. What is known is that the yen was 0.6% weaker last week and has moved to neutral TREND in Hedgeye's framework — no longer a one-way carry trade, not yet a reversal.
- **China has the most benign setup and the least conviction behind it.** Shanghai rose 0.86% Monday to 77.8% of its risk range, and Hedgeye has it back to bullish TRADE while holding no position either way. Higher crude is a straightforward negative for a net importer.
- **The single instrument most likely to move today is crude**, and the reason is that nothing has resolved. Iran has promised retaliation, the strait remains open, and the market has priced roughly 3%. Any headline in either direction moves oil more than it moves equities, and every Asian index takes its second-order cue from it.

13 AI watch

- **The memory shortage is now a physical constraint, not a forecast.** DRAM pricing is surging, semiconductor lead times reached roughly 40 weeks by March 2026, and memory integrated circuits are among the most acutely constrained categories in the supply chain. This is what Micron at \$958.73 and SanDisk at \$1,566.70 — against a 52-week low of \$50.07 — are pricing.
- **The Nvidia-OpenAI arrangement remains the largest single capital commitment in the sector.** A letter of intent covers at least 10 gigawatts of data centres, with Nvidia committing up to \$100bn progressively as systems deploy, the first gigawatt expected in the second half of 2026 on the Vera Rubin platform. Separate reporting describes talks over a backstop of up to \$250bn.
- **The scepticism is now attached to specific numbers.** Fortune reported on 18 August that the OpenAI data-centre commitment came in \$145bn below initially reported figures, framing it as evidence of artificial demand signalling. When the correction to a headline is larger than most companies' market capitalisation, the headline was not information.
- **Goldman Sachs projects hyperscaler capital expenditure of \$1.15tn across 2025-2027**, more than double the \$477bn spent from 2022 to 2024. The financing structure is changing with it: Nvidia has been reported pursuing \$500bn of chip financing with Wall Street counterparties, which moves the sector's risk from operating to balance-sheet.
- **DeepSeek is closing roughly ¥50bn (about \$7.4bn) at a ¥500bn (about \$74bn) pre-money valuation**, targeting an end-August close and opening the path to a possible 2026 listing.
- **And the tape disagrees with all of it.** The SOX is up 58.26% year to date and down 1.54% over the last month. Every capex headline this month has been larger than the last, and the index that should benefit has gone sideways for four weeks. Either the spending is already discounted or the market has begun to doubt the returns.

14 Beyond the markets

- **Bitcoin is up 25.60% in a month and down 9.86% on the year.** Both numbers are true and almost nobody quotes the second one. A rally of that size that leaves an asset a tenth lower on the year is a recovery from a drawdown, not a bull market, and Hedgeye's own note describes Ethereum as the first crypto asset it would buy — after a correction.
- **Oracle is 56.9% below its 52-week high of \$345.72** while the semiconductor index is up 58.26% year to date. Both were sold as AI infrastructure exposure twelve months ago. Only one of them was.

- **WTI is up 50.43% year to date** — the largest move in any major asset class this year — and it is happening while the Federal Reserve is being described as hawkish and the manufacturing surveys are contradicting each other. Energy is doing the work that the inflation narrative claims for wages and services.
- **The Russell 2000 gained 0.12% over the last month.** The broadening trade, the reflation trade and the rate-cut trade all lived in small caps at various points this year. All three have quietly stopped paying, and the index is up 18.65% year to date, which is why nobody has noticed.
- **Utilities are down 1.54% on the year** — the only S&P sector negative on the year besides communications and discretionary — in a year the index is up 11.75%. The bond-proxy trade has been the single cleanest expression of the rate regime and it has been available in plain sight for months.
- **Two ratings agencies entered a momentum screen on the same day.** S&P Global and Moody's were both added to Hedgeye's Signal Strength list on Monday, alongside three consumer-credit names. Ratings agencies gaining momentum is usually a bet on issuance volume; consumer-credit names gaining it alongside is a bet on something else entirely.

15 Appendix — stock cards

TSLA · TESLA

367.95 +5.51%

Cap \$1.45tn · 52w 297.38–498.83 · next: Cybercab event 3 Sep

Best S&P performer on a down day, on a Nevada approval for up to 5,000 autonomous vehicles and event anticipation. Up 18.81% over a month, down 19.63% on the year. The move is a re-rating of a story, not of a quarter.

GOOGL · ALPHABET

339.35 –2.09%

Cap \$4.13tn · 52w 206.20–408.61 · 17.0% below 52w high

The largest single drag on both headline indices. Extends a de-rating on AI product delays and technical departures that Bloomberg sized at \$692bn on 27 August. Down 0.43% over a month while the Nasdaq gained 4.07%.

SNDK · SANDISK

1,566.70 +5.50%

Cap \$229.4bn · 52w 50.07–2,354.39 · MSCI add effective 31 Aug close

Reversed a 2%-plus intraday loss into a 5.5% gain on index-review flow. The 52-week range spans a factor of forty-seven. Whatever this is, it is not a stock being valued on cash flows.

MU · MICRON

958.73 +2.77%

Cap \$1.08tn · 52w 114.25–1,255.00 · 23.6% below 52w high

The purest listed expression of the memory shortage, with lead times near 40 weeks and DRAM pricing rising. A trillion-dollar capitalisation against a 52-week low of \$114.25 is the single most violent re-rating in large-cap technology this cycle.

MSFT · MICROSOFT

507.29 –1.22%

Cap \$3.77tn · 52w 349.20–553.72 · +12.73% 1m, +4.73% YTD

The best one-month performer in the Mag7 and nearly the worst year-to-date. Hedgeye describes flipping from short to long here as one of its better recent pivots; the month's numbers support that, the year's do not yet.

NVDA · NVIDIA

220.78 +1.48%

Cap \$5.32tn · 52w 164.07–236.54 · 6.7% below 52w high

The world's largest company and the reason the Nasdaq lost only 0.12% while the Dow lost 0.70%. Up 11.26% over a month against a semiconductor index down 1.54% — the index's weakness is everything that is not Nvidia.

WDAY · WORKDAY

197.45 –3.55%

Cap \$47.6bn · 52w 110.36–249.85 · reported 27 Aug

Still de-rating four sessions after results. Backlog of \$27.4bn (+8%) against roughly \$28.6bn expected; AI above 25% of new contract value was not enough when guidance only met forecasts. The software multiple is now doing the work.

ORCL · ORACLE

149.12 –1.15%

Cap \$429.5bn · 52w 114.50–345.72 · 56.9% below 52w high

More than halved from its high while the AI infrastructure narrative it was bought for has only grown louder. The clearest available evidence that the trade has been discriminating between suppliers rather than lifting all of them.

16 About this edition

- **Covers** — the settled US cash session of Monday 31 August 2026, the after-hours tape, the Globex session to 17:00 ET and the six minutes since its 18:00 ET reopen, plus the full Hedgeye evening publication set and overnight FX, crypto and commodities.
- **Captured** — 06:07:10–06:07:13 GMT+8, a 2.4-second window, TradingView primary. A supplementary probe ran at 06:12 GMT+8 to resolve two questions. Yahoo Finance aborted on its rate-limit circuit breaker, so the machine capture is single-sourced; independent manual cross-checks and every divergence are documented in section 18.
- **Unusual this run** — the run fired at 06:06 GMT+8, which is **six minutes after Globex reopened**. The futures, spot-metals and most spot-FX daily bars rolled to a new session during the capture itself: at 06:07 they still carried Monday's completed session, and by 06:12 they had rolled to a new one holding a few hundred contracts. Every affected row is labelled in section 1, and no six-minute change figure is presented as a move.

- **Settled versus live** — cash equities, index futures, Treasury yields, energy and metals futures are **settled**. Spot metals, EUR/USD, USD/JPY, USD/CNH, GBP/USD and AUD/USD are technically live but hold only six minutes of trade. USD/KRW and USD/TWD carry a full Monday Asian session. **Bitcoin and Ether are the only genuinely live rows in the document.**
- **Hedgeye edition** — full subscriber tier reached. The live risk-range set is the Early Look "Fed Hawkish In #Quad3" by Keith McCullough, published 31 August 19:43 GMT+8; today's Early Look at approximately 19:40 GMT+8 supersedes it. Also read: The Macro Show summary notes (22:33), ETF Pro Plus (22:34), Signal Strength Stocks (23:34) and Capital Allocation Pro (00:21 today).
- **Quad path — 3 → 1 → 2, unchanged.** Printed explicitly as "the pending Quad Count of 3-1-2" in Monday's Macro Show deck, with September named as Quad 1. This is an observed printed path, not an inference.
- **Not available** — the Friday 28 August Early Look, so band moves are unknown; the IGV price; the Capital Allocation Pro model-portfolio changes, which are published as an image and a gated PDF; and any Asian cash tape, none of which had opened.

17 Sources

Prices. TradingView bulk scanner, 96 instruments captured 06:07:10-06:07:13 GMT+8, with a supplementary 15-instrument probe at 06:12. Yahoo Finance was queried concurrently and aborted after five consecutive HTTP 429 responses, returning nothing.

Hedgeye. The logged-in research feed at app.hedgeye.com: Early Look (31 Aug, 07:43 EDT), The Macro Show summary notes and replay (10:33 EDT), ETF Pro Plus update (10:34 EDT), Signal Strength Stocks (11:34 EDT) and Capital Allocation Pro (12:21 EDT). All timestamps converted from ET at +12 hours for US daylight time.

Macro and policy. The Bureau of Labor Statistics release schedule for the 4 September employment situation; ISM's report calendar; Chicago PMI and Dallas Fed manufacturing figures via Investing.com, FXStreet and fx.co; Advisor Perspectives for the 28 August Treasury yield closes used as a cross-check.

Session narrative and single stocks. CNBC, Yahoo Finance, The Motley Fool, TheStreet, 24/7 Wall St., Bloomberg (Alphabet market-value report, 27 Aug), StockStory and TradingKey for Monday's recap and the Tesla, SanDisk, Alphabet, Goldman Sachs and Workday moves; MSCI's August index review for the SanDisk addition.

Commodities, geopolitics and AI. Bloomberg, NBC News, OPB and Military.com for the Strait of Hormuz strike and CENTCOM's account; CNBC and Fortune for the Nvidia-OpenAI arrangement and its revision; Accuris for semiconductor lead times and memory constraint; a published gamma report dated 31 August for the dealer gamma flip level; Qz for September seasonality conditioned on a positive August.

18 Data-confidence

CROSS-CHECKS PASSED

- **The machine reconciliation is empty and that is the honest description.** capture.py reports 0 matched within 5bp, 0 minor, 0 divergent and **57 single-sourced** pairs. There are no divergent rows to resolve because no second machine source ran — Yahoo aborted after five consecutive HTTP 429s in 2.4 seconds. This is not a clean reconciliation; it is the absence of one, and it was repaired by hand below.
- **Headline index closes independently confirmed.** Wire and vendor recaps of Monday's session give S&P 500 **7,686.14 (-0.33%)**, Nasdaq Composite **26,370.89 (-0.12%)** and Dow **53,185.90, -374.09 points (-0.70%)** — matching the capture to the cent on all three, from a source with no connection to TradingView.
- **The ten-year reconciles exactly.** Capture shows 4.754% with a +2.4bp change, implying a Friday close of 4.730%. Advisor Perspectives records the 28 August close at 4.73%. Independent confirmation of both the level and the direction, which matters because the breakout above Hedgeye's 4.74 ceiling rests on it.
- **Futures-to-cash basis is normal across all four contracts**, which confirms the settles are settles rather than mislabelled live prints: ES 7,699.00 against SPX 7,686.14 is +12.86; YM 53,240 against DJI 53,185.90 is +54.10; RTY 2,958.70 against RUT 2,956.45 is +2.25. All positive carry, all proportionate.
- **Cash index arithmetic is self-consistent.** S&P: 7,686.14 close less 25.62 change gives a 7,711.76 prior close; the 7,697.52 open sits below it, consistent with a lower opening. Dow: 53,185.90 plus 374.09 gives 53,559.99 prior; against a 53,462.60 open — likewise. Both indices opened at their session highs, which the O/H/L bars confirm independently.
- **The session-roll question was settled with data, not judgement.** At 06:07 the ES bar showed 1,174,219 lots and a 49-point range; at 06:12 it showed 625 lots and a 2.5-point range. The bar rolled between the two probes, which establishes that every futures figure in section 1 is Monday's settled session and that the reopen prints carry no information.
- **Two conflicting monthly-performance claims were resolved against data.** One recap reported August gains of +12.3% for the S&P, +13.5% for the Nasdaq and +19.1% for the Russell 2000; another reported +2.6% and +3.9%. TradingView's trailing one-month figures are +3.00%, +4.07% and +0.12%. The first set is rejected as garbled — a 19.1% month in small caps is not a plausible reading — and the brief uses the second, cross-checked against the trailing figures.

KNOWN CONFLICTS AND WEAK MARKS

- **The two-year yield disagrees by 2bp.** Capture gives 4.346% with a -1.4bp change, implying a Friday close of 4.360%; the independent source records 4.34%. The brief uses the captured 4.346% and the derived 3.8bp steepening in 10s2s. Had the alternative Friday close been correct, Monday's two-year change would be roughly +0.6bp rather than -1.4bp and the curve

would have steepened only 1.8bp. The direction of the steepening survives either figure; the magnitude is uncertain within about 2bp.

- **The dealer gamma flip level at 7,695 is a single-source estimate** from one published gamma report, and providers routinely disagree on flip levels by tens of points. The finding that the S&P settled 8.86 points below it is therefore robust as a description of a near-level close and fragile as a claim that the regime actually flipped. Hedgeye, citing Tier1 Alpha the same morning, described dealer gamma as positive. Both are reported.
- **The dollar index change covers a different session from the FX majors.** DXY shows −0.26% across a 99.39–99.71 range, which is a full session; EUR/USD and USD/JPY show five- and seven-pip ranges, which are six minutes. The DXY figure is therefore treated as Monday's move and the majors are not, on the basis of range plausibility rather than a documented session calendar. If TVC's DXY series in fact rolled with the majors, that −0.26% would be badly overstated. Flagged as the weakest inference in the document.
- **Utilities' one-month decline is reported three ways.** Hedgeye's Early Look says XLU is down 6.1% in the last month; the Macro Show summary says down 3.7% for August; TradingView's trailing one-month reads −5.34%. The windows differ and none is wrong. The brief cites Hedgeye's own 6.1% when attributing to Hedgeye and TradingView's −5.34% in the sector table, and does not blend them.
- **Workday's post-earnings price history is unreliable in the secondary sources.** One outlet places the stock at \$179.99 after its 27 August report, roughly 9% below Monday's captured \$197.45. That figure is not used anywhere in this brief; only the captured close and the backlog figures (\$27.4bn against roughly \$28.6bn expected) are reported, and the backlog numbers themselves come from a single secondary source.
- **Percentage-below-52-week-high figures rest on one field from one source.** Oracle at 56.9% below \$345.72 and SanDisk's 52-week low of \$50.07 are drawn from TradingView's 52-week fields with no second source. The conclusions those numbers support are robust; the decimals are not.
- **The September seasonality statistic is conditioned twice** — on a positive August and on a year-to-date gain between 10% and 17.5% — which reduces a century of history to a small number of observations. It is reported as context, not as a base rate.

KNOWN GAPS

- **Band moves versus the prior Early Look are UNKNOWN, not unchanged.** The Friday 28 August note could not be reached: the Early Look category page does not paginate, and the unfiltered feed returned the same top article on page 3. No diff of floors, ceilings or band widths was possible this morning, and the absence of a reported move must not be read as stability.
- **The Capital Allocation Pro model-portfolio changes could not be read.** They are published as a PNG chart and a separately gated PDF. This is the specific publication that would have carried Monday's actual position changes at the portfolio level. **Absence of a Hedgeye position change in this brief is not evidence that there was none.**
- **The MOMO Tracker and Crypto Quant did not appear in the feed since the previous edition,** and both are routinely image-based and unreadable when they do. Together with Capital Allocation Pro these are the publications that would carry position changes not visible in the Early Look or the Macro Show.
- **The IGV price was not captured** — the ticker returned no data across three exchange prefixes — so its position within the 103.00–112.00 risk range is unknown. It is the only line in the risk-range table without a computed position.
- **Calendar consensus figures other than the BLS date are from secondary calendars and are unconfirmed.** Published calendars disagreed on whether JOLTS falls on Tuesday or Wednesday, and several returned plainly stale content — one asserted that US markets would be closed on Monday 1 September for Labor Day, when 1 September 2026 is a Tuesday and Labor Day falls on the 7th. The 4 September employment situation was verified directly against the BLS schedule; nothing else in section 8 was.
- **No Asian cash market had opened** at capture — Tokyo and Seoul open 08:00–08:30 GMT+8, Hong Kong 09:30, India 12:15 — so every Asian level in this brief is Monday's close, marked as such.
- **After-hours moves were immaterial and are not reported as a section.** Post-market prints across the captured universe were within ±0.5% and no significant earnings landed in the 16:05–18:00 ET window.

TIMING & UNVERIFIED

- **Capture window 06:07:10–06:07:13 GMT+8, 2.4 seconds,** with a supplementary probe at 06:12:12. Nothing in this document was captured outside those two moments.
- **Age of the stalest rows: the US cash equity closes are 2.1 hours old** at capture (16:00 ET Monday to 06:07 GMT+8 Tuesday). Monday's Globex settles are 1.1 hours old. Previous Asian closes are between 12 and 18 hours old. The Hedgeye risk ranges were published 10.4 hours before capture.
- **The six-minute problem, stated plainly.** Globex reopened at 18:00 ET, six minutes before this run fired. Change figures on spot metals and on EUR/USD, USD/JPY, USD/CNH, GBP/USD and AUD/USD therefore measure six minutes of trade on a few hundred contracts or a handful of pips. They are noise and are labelled as such throughout. They are not presented as moves and should not be read as any.
- **What will be superseded today.** Every risk range in section 4 is replaced by today's Early Look at approximately 19:40 GMT+8. The ISM manufacturing print at 22:00 GMT+8 will reprice the Chicago-versus-Dallas contradiction one way or the other. Any Strait of Hormuz headline supersedes the crude levels immediately.
- **Verify live prices before acting on anything in this document.** Asia had not opened at capture, US futures held six minutes of trade, and the single most consequential input — a live military situation in a strait carrying a fifth of the world's seaborne oil — is capable of moving every level here between publication and the Tokyo open.
