

Daily Need to Know

Friday, 11 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — SETTLED 16:00 ET THU 10 SEP = 04:00 GMT+8, ~2H 10M OLD			
S&P 500	7,591.70	▼ 44.66 · −0.58%	Fourth straight down day. Range 7,580.06–7,612.86; closed at 35% of it. Below Hedgeye's 7,601 floor — the index has lost the band.
Nasdaq Composite	26,081.72	▼ 171.62 · −0.65%	Only index still inside its band, and only by 10%. Volume 6.38bn vs 6.52bn 10-day average — the selling is not panic.
Dow Jones Industrial	52,064.10	▼ 316.56 · −0.60%	Opened at the high (52,291.85) and never traded above it. Closed at 31% of range.
Russell 2000	2,890.95	▼ 30.37 · −1.04%	Worst major. Closed at 12% of range and below the new 2,901 floor . Hedgeye cut this band to bearish overnight.
Philadelphia SOX	11,614.16	▼ 317.28 · −2.66%	Four times the S&P's loss. 20.8% below its 14,655 52-week high. Memory names led it down.
INDEX FUTURES — SETTLE 17:00 ET, THEN LIVE GLOBEX PRINT AT 06:13 GMT+8 (13 MIN OF THE NEW SESSION)			
ES (E-mini S&P)	7,601.25	▲ 0.04%	Settled 7,598.50 (−0.59%). Live on 783 lots — thin. Basis to cash +6.80 pts, normal, which confirms the cash print is a true settle.
NQ (E-mini Nasdaq)	29,143.00	▲ 0.03%	Settled 29,135.25 (−1.06%). Session low 29,043.25 held. 464 lots live.
YM (E-mini Dow)	52,095	▼ 0.63%	Settle only — no live print retrieved at 06:13. Basis to cash +30.9 pts, normal.
RTY (E-mini Russell)	2,891.00	▼ 0.08%	Settled 2,893.40 (−1.01%). The only equity future lower overnight. 151 lots.
US TREASURIES — CASH YIELDS, THURSDAY'S SETTLE MARKS (INDEX SERIES, NOT ROLLING)			
US 10-year	4.961%	▲ 11.6bp	Fresh 52-week high. The intraday high 4.965% is the 52-week high; the close is 0.4bp off it. Through Hedgeye's 4.89 ceiling.
US 30-year	5.366%	▲ 7.3bp	Also a fresh 52-week high (5.373% intraday). Rose least of the curve — this was a front-end event.
US 5-year	4.760%	▲ 14.0bp	Fresh 52-week high. The belly took the hike repricing hardest after PPI.
US 2-year	4.586%	▲ 15.0bp	Biggest move on the curve and a fresh 52-week high. 2s30s flattened 7.7bp; 2s10s to 37.5bp from 40.9bp.
US 13-week bill	3.952%	▲ 5.2bp	Still 19.7bp below its own 52-week high of 4.149%. The only tenor not making new highs — the front end is pinned by a policy rate that has not moved yet.
ENERGY — SETTLE 14:30 ET, THEN LIVE GLOBEX PRINT 06:13 GMT+8			
WTI crude (CL1)	104.05	▲ 1.53%	Settled \$102.48, +6.69% — the day's story. Range 95.37–104.04. Live print is <i>above</i> the settle range. 1,769 lots.
Brent (BZ1)	109.28	▲ 1.53%	Settled \$107.63 . Range 100.19–109.05. Highest since the July spike; 8.5% below the \$119.40 52-week high.
Natural gas (NG1)	2.837	▲ 0.11%	The one energy contract going nowhere: +0.43% on the settle. Sits 7.5% above the 2.64 stop Hedgeye named for its 1% position.
RBOB gasoline (RB1)	3.4300	▲ 1.08%	Settled 3.3932, +5.69% . Pump price already \$4.15/gal against \$2.98 pre-war; diesel at a record \$5.94.
METALS — SPOT LEVELS LIVE AT 06:13 (SESSION ONLY ~73 MIN OLD); FUTURES SETTLES SHOWN FOR THE DAY'S MOVE			
Gold (spot)	4,322.45	◆ +0.10% (73 min)	Futures settled 4,407.30, −1.20% and reopened at 4,362.00. Spot is \$58 below the 4,380 line Keith named as gold's TRADE level.
Silver (spot)	63.574		

ASSET	LAST	CHANGE	NOTE
		◆ +0.01% (73 min)	Futures settled 64.927 , -5.42% — the largest single-day loss anywhere in this table. Spot is below Hedgeye's 64 floor.
Copper (spot)	6.4084	◆ +0.07% (73 min)	Futures settled 6.5475 , -4.95% , two sessions after a 6.894 record. Spot sits 2.1% under futures and below the 6.55 floor.
FX — DXY AND ASIAN CROSSES ARE THURSDAY SETTLES; MAJORS LIVE FROM THE 05:00 GMT+8 REOPEN (~73 MIN)			
DXY	99.092	▲ 0.31%	Thursday settle; identical across two pulls five minutes apart, so not live. Range 98.706-99.199. Keith flagged 3-month lows at \$98.91 in the morning — it closed above that.
USD/JPY	154.527	◆ +0.07% (73 min)	Yen still signalling bullish TREND per Hedgeye. 5.8% below the 163.99 52-week high; no intervention chatter in the tape.
USD/KRW	1,348.67	▲ 0.65%	Stale — Asian-hours mark, roughly 24h old. Won closed at 1,349.56 intraday, its weakest print of the session. Korea reopens into a weaker won and a -2.66% SOX.
VOLATILITY AND CRYPTO — VIX IS THURSDAY'S SETTLE; CRYPTO GENUINELY LIVE AT 06:13			
VIX	17.85	▲ 1.38 · +8.38%	Second consecutive close above Hedgeye's ceiling while the signal still reads bearish. High 18.17. Still only half the 35.30 52-week high.
Bitcoin	77,126	▼ 1.49%	Live. Range 76,683-78,532. Sits 2.8% above the \$75,000 TRADE line Keith uses to cut back to minimum size; TREND is \$70,000.

Colour key: the glyph gives the direction of the move (▲ up, ▼ down, ◆ a change measured over a partial session and therefore not a day's move); the colour gives its risk direction, so a rising yield, a rising VIX and a weakening Asian currency are red even though the number went up. Reconciliation: Yahoo Finance returned nothing this run (HTTP 429 circuit breaker), so machine capture is single-sourced on TradingView. Index closes and point changes were verified by hand against wire copy — all four matched to the decimal; WTI \$102.48 and Brent \$107.63 matched to the cent. Full detail in section 18.

TL;DR

Iran attacked **ten merchant ships** near the Strait of Hormuz on Thursday — the heaviest declared day of shipping attacks in a war now 195 days old — and WTI settled **+6.69% at \$102.48**, Brent at **\$107.63**. That is now an inflation event rather than an energy event: August PPI printed **+5.4% y/y against a 5.3% consensus**, every Treasury tenor from two years to thirty made a **fresh 52-week high**, and the market-implied odds of a **rate hike** next Wednesday moved above **73%** from roughly 62% a month ago. Equities fell for a fourth straight day but modestly — the S&P lost 0.58% on below-average volume. The real damage was in duration and in metals: TLT and LQD both printed fresh 52-week lows, silver futures fell 5.42% and copper 4.95%. **Nine of the fourteen measurable Hedgeye risk ranges are trading outside their bands** — three above the ceiling, six below the floor. And the tell nobody led with: **energy was not the winner**. XLE printed a fresh 52-week high intraday and closed **down 0.58%**, in the bottom third of its range, on the biggest crude rally of the year. August CPI lands today at 20:30 GMT+8.

2 The big picture — what it means

1. The oil move stopped being about oil on Thursday and became about the Fed. A 6.69% day in WTI is not remarkable in a war; a 6.69% day in WTI that takes the two-year yield up 15bp and the implied odds of a September hike from roughly 62% to above 73% is. The transmission ran through PPI: final-demand goods rose **1.1%** in August, which is where the fuel is, and dragged the headline to **+5.4% y/y** — a tenth above consensus. Core PPI at **+0.2%** came in *under* the +0.3% forecast, so the underlying disinflation story is intact. The market chose to trade the headline.

2. Every Treasury maturity from two years out to thirty made a new 52-week high, and the three-month bill did not. That gap is the whole argument. The bill is anchored 19.7bp below its own high because the policy rate has not moved; everything the market prices itself is at a cycle extreme. The curve bear-flattened — 2s30s in by 7.7bp — which is the shape you get when a market expects tightening to work rather than fiscal risk to compound. That is a meaningfully different signal from the steepening that dominated August.

3. Bond volatility broke out before bond prices did. MOVE closed at **82.09, up 6.98%**, having opened at 76.74 and never traded below it. It is the highest reading since the August episode and 28.7% off the 55.77 low set earlier in the cycle. When the MOVE index makes its high on the close after a data print, the repricing is usually not finished.

4. Equities are behaving far better than the rates market says they should. Four consecutive down days have cost the S&P a cumulative move of well under 3%, Thursday's volume was *below* the ten-day average, and the VIX at 17.85 is half its 52-week high. But breadth is doing the work quietly: equal-weight RSP fell 0.69% against SPY's 0.60%, and the Russell closed at 12% of its daily range. The index is being held up by a handful of very large names — Apple alone added roughly \$164bn of market value on Thursday.

5. The metals complex broke, and that is the cleanest read on real rates in the whole tape. Silver futures -5.42%, copper -4.95%, gold -1.20% — all on a day when crude rose almost 7%. A commodity rally that excludes the monetary metals is not an inflation trade; it is a supply shock landing on top of a tightening expectation. Gold spot at

4,322 sits \$58 below the 4,380 line Keith McCullough named on Thursday's Macro Show as the level that governs whether he adds.

6. The one sector that should have won, lost. XLE traded to **66.17, a fresh 52-week high**, and closed at 64.93 — down 0.58%, in the bottom third of the day's range, on 37.2m shares against a 27.9m average. A sector making a new high on its best possible news and closing red on heavy volume is distribution. Hedgeye still ranks Energy its number one sector by signal strength and is long OIH; that position and Thursday's tape now disagree.

7. Nine of fourteen risk ranges are outside their bands, and the breaks are not random. The three above the ceiling are **the 10-year yield, the VIX and crude** — the inflation-and-fear complex. The six below the floor are **the S&P, the Russell, HYG, LQD, copper and silver** — equities, credit and industrial metals. That is a coherent regime break, not noise, and it happened while Hedgeye's published TREND signals still read bullish on the S&P and on gold. Signals lag levels by design; this is the gap where the lag lives.

3 Rates, currencies & commodities

- **The auction and the buyback tell opposite stories.** Wednesday's Treasury buyback capped at \$6bn against guidance of "at least \$4bn" and expectations nearer \$10bn, and yields rose anyway; the following 10-year auction then cleared well, bid-to-cover 2.71x from 2.53x with dealers taking only 4.3%. Demand exists. Price does not.
- **The dollar's rally is a Thursday artefact, not an overnight one.** DXY at 99.092 is +0.31% but the identical figure returned on two pulls five minutes apart, so this is a settle. Hedgeye's band moved *down* both ends and still reads bearish USD; the index is at 66% of that band and 2.7% below its 101.80 52-week high.
- **Offshore renminbi is within 0.16% of its strongest level in a year** at 6.7138 against a 6.70286 52-week low. Beijing is letting the currency firm into an oil shock, which is the opposite of the 2022 playbook and worth watching as an import-cost offset.
- **Crude is extending, not consolidating.** The settle at \$102.48 was already the high end of the day; the 06:13 Globex print at **\$104.05** is above the entire settle-session range, on 1,769 lots. Brent at \$109.28 is doing the same. Asia opens into an oil market that has not stopped.
- **Natural gas is the dissenter.** +0.43% on the settle and 30% of its band while every other energy contract gapped. Hedgeye holds a minimum 1% position with a hard 2.64 stop; the contract at 2.837 has 7.5% of room and no momentum.
- **Credit cracked quietly.** LQD closed at 104.36 having printed **104.325, a fresh 52-week low**; TLT closed 80.78 after printing **80.665, also a fresh 52-week low**. HYG at 78.62 came within 5.5 cents of its own. Hedgeye is short TLT, ZROZ and LQD and sold its HYG long on 9 September — that book is working.

4 Hedgeye — regime, risk ranges & the Quad path

Macro dashboard

READ	CALL	STATUS THIS MORNING
US monthly Quad	Quad 2 — growth up, inflation up	Written confirmation dates from the 9 Sep Early Look ("CRB ramped to new #Quad2 Cycle Highs"). Thursday's note does not restate it; the Macro Show says only that "the macro regime is no longer Quad 4".
US quarterly Quad	Quad 4 — growth down, inflation down	Carried forward from the 4 Sep Macro Week Summary dashboard, now seven days old and not republished. Sits in direct tension with the monthly read.
Global Quad	Quad 3 — growth down, inflation up	Carried forward. Unchanged.
Forward Quad path	UNREAD	The path notation lives on page 2 of the Macro Week Summary Notes PDF, behind a separate link. Fifth consecutive edition unable to read it. Absence of a printed path is not evidence the path is unchanged.
Inflation Nowcast	Re-accelerating	Monthly re-acceleration through August and September from July's 3.36% y/y; quarterly tracking toward 3.76% y/y in Q4 2026 — roughly 38bp above the Cleveland Fed nowcast.
Bond volatility	MOVE 82.09	Up 6.98%. Hedgeye's sub-75 bond-vol condition has now clearly failed; the index opened at its low and closed at its high.

Risk Range™ Signals — Early Look, published 19:39 GMT+8 Thu 10 Sep, "Betting \$1T On Inflation Accelerating", Keith McCullough

INSTRUMENT	RANGE	TREND	BAND MOVE VS 9 SEP	LIVE / SETTLE	WHERE IT STANDS
UST10Y	4.70–4.89	bullish	floor +2bp · ceil +3bp · wider 1bp	4.961	137% — 7.1bp THROUGH the ceiling. Band raised and price cleared it anyway.

INSTRUMENT	RANGE	TREND	BAND MOVE VS 9 SEP	LIVE / SETTLE	WHERE IT STANDS
HYG	78.91–79.49	neutral	unchanged · signal cut from bullish	78.62	–50% — below the floor. Signal downgraded two days after Hedgeye sold the long.
LQD	104.8–106.1	bearish	floor +0.20 · ceil 0 · narrower 0.20	104.36	–34% — below the floor on a fresh 52-week low. Short working.
SPX	7601–7757	bullish	floor –3 · ceil –10 · narrower 7	7,591.70	–6% — 9.3 pts below the floor while the TREND signal still reads bullish.
COMPQ	26014–26683	bullish	floor +6 · ceil –28 · narrower 34	26,081.72	10% of band. The only US equity index still inside.
RUT	2901–2988	bearish	floor –11 · ceil –26 · signal cut from neutral	2,890.95	–12% — below the floor. Band cut and downgraded, and price is still under it.
XLV	165–175	bullish	floor –1 · ceil 0 · wider 1	165.66	7% of band. Floor cut a second time to keep the long inside.
IGV	99–112	bullish	unchanged	—	Not in the capture universe. Sixth consecutive edition unmeasured.
OIH	415–442	bullish	floor +1 · ceil –2 · narrower 3	—	Not in the capture universe. Hedgeye is long this and ranks Energy #1.
VIX	14.25–17.01	bearish	floor +0.40 · ceil +0.67 · wider 0.27	17.85	130% — 0.84 through the ceiling for a second session, signal still bearish.
USD	98.33–99.49	bearish	floor –0.08 · ceil –0.03 · wider 0.05	99.092	66% of band. Band drifting down while price pushes the top half.
WTIC	88.12–99.91	bullish	floor +1.76 · ceil +2.38 · wider 0.62	102.48	122% on the settle, 135% on the 06:13 print. Largest band chase in the table and price still \$2.57 clear.
NATGAS	2.75–3.03	bullish	floor –0.05 · ceil 0 · wider 0.05	2.834	30% of band. Floor cut to keep a losing 1% position inside.
GOLD (spot)	4301–4502	bullish	floor +11 · ceil –97 · narrower 108	4,321.74	10% of band. Largest compression in the table — ceiling cut \$97 in one session.
COPPER (spot)	6.55–6.85	bullish	floor +0.06 · ceil +0.10 · wider 0.04	6.4124	–46% — below the floor. Band raised into a 4.95% futures collapse.
SILVER (spot)	64–68	neutral	unchanged	63.558	–11% — below the floor after a 5.42% futures rout.

Measured on the series Hedgeye names: spot for gold, silver and copper (TVC:GOLD, TVC:SILVER, OANDA:XCUUSD), continuous contract for crude and natural gas (NYMEX:CL1!, NYMEX:NG1!). Reading gold on futures instead of spot would put it at 30% of band rather than 10%; copper on futures would read –1% rather than –46%. Band moves are one session, 9 Sep → 10 Sep, diffed against the archive state file because the Early Look category page does not paginate. **Nine of the fourteen measurable rows are outside their bands** — three above, six below.

What Keith actually said

From the Early Look, "Betting \$1T On Inflation Accelerating", published **19:39 GMT+8 Thu 10 Sep** (07:39 ET):

- "UST 2yr Yield ramping to new Inflation Cycle Highs at **4.44%** with the TRR up at 4.50%" — written before the close. It finished at 4.586%, **through his own top-end signal**.
- "UST10yr Yield ramping to new Inflation Cycle Highs at **4.86%** with the TRR up at 4.89%" — it closed at 4.961%, 7.1bp above the ceiling he published that morning.
- "US Dollar Index = **\$98.91** (right around 3-month lows with Japanese Yen still signaling Bullish TREND)". DXY closed at 99.092.
- "That means being long **BUXX and CLOX** instead of long-term Treasuries (TLT). As a reminder, TLT remains one of The Fam's biggest shorts alongside **ZROZ, LQD, and Rate Sensitive Utilities (XLU)**."
- "**ROC Numbers > Political Narratives**. 100% of the time."

From the Macro Show summary notes, 22:34 GMT+8 Thu 10 Sep. *These are AI-generated summaries carrying their own error caveat, so they are reported as attributed summary and not inside quotation marks:*

- Top three sectors by signal strength are **Energy #1, Software #2, Healthcare #3**, and Hedgeye is long all three. Utilities and Industrials remain shorts, Industrials described as shorted "two different ways".
- With the S&P below its TRADE level — corrected on air to approximately **7,662** — no US equity exposure has been bought through real-time alerts for three days. Reclaiming TRADE turns the yellow light green.

- Roughly **80%** of S&P constituents fell in the prior session. The "Industrials Most Short" hedge-fund basket fell 4.1% while high-beta momentum rallied 2.4%.
- Gold is held at minimum size with the TRADE level at approximately **4,380**; above it he adds on declines, below it 4,380 becomes the stop on the incremental piece. Spot is \$58 below that line this morning.
- Bitcoin is bullish TRADE and TREND and described as materially more bullish than gold, with **\$75,000 TRADE and \$70,000 TREND**. Natural gas is a 1% position with a hard **2.64** stop.
- The most significant allocation statement: his last **seven** newly added positions out of 27 total were **not US equities**. Recent adds are Singapore (EWS), Corn and Wheat. New Zealand was exited and replaced with Singapore; KOSPI deliberately untouched near its TRADE line; India back to bearish TRADE and TREND.

Position changes since the previous edition. ETF Pro, 21:57 GMT+8 Thu 10 Sep: **REMOVING long Digital Payments (IPAY)**, range 49.06–53.36 — a broken TRADE and/or TREND, and the only change on the tape. Signal Strength Stocks last refreshed 9 Sep at 61 names (added PFE, U, CAH, FSK, VREOF, SNDL; removed SPGI, SBUX, COF, SHOP, EVER, BRCB) and has not been rerun since. The Portfolio Solutions daily ETF re-rank for 10 Sep put **OIH +17** as the largest mover, with FXC +7 and MSOS +7.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Apple	326.57	▲ 3.56%	\$4.77tn	The session's outlier. 70.0m shares against a 44.7m average on the foldable iPhone Duo launch, the first product cycle under CEO John Ternus. Added roughly \$164bn of value. Cleared the ~314 TRADE line Keith used as a live example.
Nvidia	218.36	▼ 2.37%	\$5.26tn	Largest company in the world and the biggest drag. 102m shares on a 146m average — light volume for a 2.4% fall. 7.7% below its 236.54 high.
Alphabet	332.60	▲ 0.59%	\$4.06tn	Second-best Mag7. Hedgeye is short this after flipping out of a long in early September — the position is offside two sessions running.
Microsoft	492.44	▲ 0.16%	\$3.66tn	Effectively flat, range 486.00–494.52. Faded 0.55% after hours. 11.1% below its 553.72 high.
Amazon	251.89	▼ 0.20%	\$2.72tn	The least eventful of the seven. Volume 25.4m against 33.3m average.
Broadcom	360.83	▼ 0.97%	\$1.72tn	Held up far better than the rest of semis — SOX fell 2.66%. 27.1% below its 495.00 high.
Meta	644.38	▼ 1.42%	\$1.64tn	Gave back part of Wednesday's 6.55% Muse-launch pop; range 642.14–663.50, closed near the low. Hedgeye is long after flipping from short.
Tesla	363.56	▼ 1.16%	\$1.44tn	27.1% below its 498.83 high, the deepest drawdown in the group alongside Broadcom.

Combined capitalisation of the eight names shown is roughly **\$25.3tn**. Apple's gain alone offset most of Nvidia's loss in index terms. Capitalisations are TradingView's market_cap_basic field, single-sourced this run.

6 Positioning & options

- **Gamma is negative again** per the Tier 1 Alpha framework cited on the Macro Show, which is the condition under which downside accelerates rather than mean-reverts. Four modest down days with negative gamma and no volume expansion is an unstable combination.
- **The S&P's mechanical level is 7,662**. Below it Hedgeye stops buying; above it the same framework is said to release roughly **\$7bn** of mechanical demand. The index closed 70 points below, so the reclaim is a real, dated, checkable threshold rather than a narrative.
- **Quadruple witching is Friday 18 September**, two days after the FOMC decision. A hike into an expiry week with negative gamma is the single most crowded piece of calendar risk on the board.
- **Volume is the argument against panic**. S&P volume 2.76bn against a 2.80bn ten-day average; Nasdaq 6.38bn against 6.52bn. Four down days, and nobody has been forced to sell yet.
- **The exceptions were in credit and energy ETFs**. HYG traded 53.4m shares against 34.8m average, LQD 35.7m against 26.5m, TLT 60.4m against 28.9m — roughly double normal — and USO 9.9m against 5.2m. The volume went where the conviction was, and it was not equities.
- **Hedgeye's own book is the cleanest positioning tell available**: seven consecutive new positions outside US equities, US credit risk actively unwound, and small-cap and quality exposure sold because "the macro regime is no longer Quad 4".

7 Sector rotation — leaders & laggards

SECTOR (SPDR)	LAST	DAY	NOTE
Communication Services (XLC)	111.50	▲ 0.61%	Only sector with a meaningful gain — and not explained by its two largest holdings, since Meta fell 1.42% and Alphabet rose only 0.59%. Breadth beneath the megacaps did the work.
Consumer Staples (XLP)	83.09	▲ 0.05%	The defensive bid, and a thin one. Led in the morning, gave it back.
Financials (XLF)	56.87	▼ 0.33%	Best of the losers. A 15bp move in the 2-year did not hurt banks.
Consumer Discretionary (XLY)	111.96	▼ 0.45%	Held up despite \$4.15 petrol. Range 111.02-112.65.
Health Care (XLV)	165.66	▼ 0.55%	Closed 3 cents off the day's low and at 7% of its risk-range band. Hedgeye's #3 long is not working.
Energy (XLE)	64.93	▼ 0.58%	Printed a fresh 52-week high at 66.17 and closed down , in the bottom third of the range, on 37.2m shares vs 27.9m average. Faded a further 0.15% after hours.
Industrials (XLI)	170.55	▼ 0.72%	Hedgeye short, working. 9.4% below its 188.19 high.
Real Estate (XLRE)	43.05	▼ 0.83%	Straight rate casualty. 7.3% above a 39.73 52-week low.
Utilities (XLU)	42.52	▼ 0.98%	Closed 1 cent off the low. Only 1.9% above its 41.74 52-week low — the closest any sector is to a new low. Hedgeye short.
Materials (XLB)	50.76	▼ 1.23%	Copper -4.95% and silver -5.42% did this. Opened at the day's low and never recovered it as a close.
Technology (XLK)	185.22	▼ 1.41%	Worst sector. Semis, not software: SOXX -2.74%, SMH -2.44%.

- **Leaders:** Communication Services and Consumer Staples were the only two green sectors, and between them they gained 0.66 percentage points. There was no leadership on Thursday, only less damage.
- **Laggards:** Technology, Materials and Utilities — an AI-capex proxy, a metals proxy and a duration proxy. Three different reasons, one direction.
- **Rotation:** equal-weight RSP fell 0.69% against SPY's 0.60%, so the average stock did worse than the index for a fourth session. Utilities within 1.9% of a 52-week low while the 10-year makes new highs is the rate trade working exactly as written; Energy making a 52-week high and closing red is the oil trade *not* working, and that is the anomaly to carry into today.

8 Forward — futures & the week ahead

Thirteen minutes into the new Globex session the equity complex is doing nothing: ES **7,601.25** on 783 lots, NQ **29,143** on 464, RTY **2,891** on 151. Those are handfuls of contracts and the changes are inside the bid-offer — they carry no information. Energy is the exception and it is emphatic: WTI at **\$104.05** on 1,769 lots is trading *above* the entire settle-session range, and Brent at **\$109.28** is doing the same. Gold futures reopened at 4,362.00, roughly \$45 under the settle, on 201 lots — a thin print that should be verified before it is traded. The genuinely live market is crypto, and Bitcoin at **77,126** is quiet. Asia therefore opens into an unchanged equity tape, a still-rising oil tape, and a Treasury market that closed at cycle-high yields and will not reprice again until the CPI print thirteen and a half hours from now.

DAY (GMT+8)	KEY EVENTS
Fri 11 Sep — today	US August CPI, 20:30. Consensus +0.4% m/m and 3.4% y/y headline; core +0.2% m/m and 2.4% y/y (Dow Jones). Hedgeye's nowcast runs 3.7-3.8%, roughly 38bp above the Cleveland Fed. This is the last inflation print before the FOMC and the entire hike debate hinges on it.
Fri 11 Sep — evening	Fed communications blackout continues to 17 Sep, so there will be no official reaction to whatever CPI shows. University of Michigan preliminary sentiment normally falls on this date — <i>unconfirmed, secondary calendar</i> .
Mon 14 Sep	No first-tier US data scheduled. Positioning day into the FOMC.
Tue 15 – Wed 16 Sep	FOMC meets. Decision Wed 16 Sep 14:00 ET = Thu 17 Sep 02:00 GMT+8 , Chair Kevin Warsh's press conference to follow. Market-implied odds of a 25bp hike above 73% after Thursday's PPI, from roughly 62% a month ago; cut odds effectively zero.
Wed 16 Sep	US August retail sales customarily prints in this window — <i>unconfirmed against the Census release schedule, treat as secondary</i> .
Fri 18 Sep	Quadruple witching. Index futures, index options, single-stock options and single-stock futures all expire, two days after the rate decision, into what is currently negative gamma.

FOMC dates confirmed against the Federal Reserve's published 2026 calendar. CPI date and consensus confirmed against BLS scheduling and Dow Jones survey reporting. Items marked *unconfirmed* come from secondary calendars and were not verified against the releasing agency this morning.

9 Corporate news

- **Oracle beat on every line and the stock moved after the close.** Fiscal Q1 2027 adjusted EPS **\$1.92 against \$1.74 expected**, revenue **\$19.35bn against \$19.14bn** — up almost 30% y/y. Net income \$4.68bn, or \$1.56 per share, from \$2.93bn a year ago. Remaining performance obligations **\$664bn against a \$630.6bn consensus**. FY27 guidance of \$8.10 adjusted EPS on at least \$90bn of revenue, with fiscal Q2 revenue growth guided to 30–34%. The shares had closed the regular session **down 5.38% at \$152.94**, 53.6% below their 52-week high, on 55.0m shares against a 28.3m average — a full capitulation into the print.
- **The after-hours mark is contested.** Our 18:08 ET capture had ORCL at **\$159.58, +4.34%**; CNBC reported the stock "jumped 7% in extended trading". Both are printed; the gap is consistent with a first-print spike fading, and neither has been reconciled against a second machine source.
- **Adobe reported fiscal Q3 after the close** with EPS of \$6.09 against \$5.31 a year earlier, full-year guidance of **\$24.45–24.50 against a \$23.49 consensus** and revenue guidance of \$26.6bn against \$26.5bn. The stock closed the regular session at \$248.83, down \$6.03. The after-hours reaction was not captured and is not reported here.
- **Memory and storage were destroyed.** Micron **–4.90%** to \$977.41, Western Digital **–4.43%**, Sandisk **–4.06%**, Intel **–5.57%** to \$100.32, AMD **–3.36%**, Applied Materials **–3.17%**. No single-name catalyst was findable for any of them; the common factor is a 15bp move in the two-year yield hitting the longest-duration equity story in the market. Sandisk is still up more than twentyfold from a \$82.28 52-week low.
- **Enbridge is buying Tallgrass Energy's crude oil business for \$2.55bn in cash**, taking a majority stake in the Pony Express pipeline and associated assets — a liquids-infrastructure bet placed on the day WTI cleared \$100.
- **Morgan Stanley upgraded DT Midstream and TC Energy to Overweight**, arguing that natural-gas pipeline names have sold off on data-centre commercialisation risk that is now in the price.
- **Tapestry rose 1.90%** to \$115.87, one of the few consumer names higher, reversing the previous session's unexplained 3.29% decline. Still 29.7% below its 52-week high.

10 Macro data

- **August PPI, final demand: +0.4% m/m — exactly in line with the Dow Jones consensus of +0.4%.** The month-on-month print was not the story.
- **August PPI, year on year: +5.4% against a 5.3% consensus** — a tenth hotter, and 3.4 percentage points above the Fed's target. This is the number that moved hike odds above 73%.
- **Core PPI, ex food and energy: +0.2% m/m against a +0.3% consensus** — softer than expected. The disinflation in the underlying series is real and the market ignored it, which tells you what it is currently frightened of.
- **The composition is entirely energy.** Final-demand goods rose **1.1%** while final-demand services rose **0.1%**. An eleven-to-one split between goods and services inflation is a supply shock, not a demand problem — and it is the part a rate hike cannot fix.
- **Initial jobless claims 206,000 against a 205,000 consensus**, down 1,000. Continuing claims **1,774,000 against 1,780,000 expected**, down 1,000. The labour market gave the Fed no reason to hold.
- **Both releases landed at 08:30 ET, 20:30 GMT+8**, and the market took the whole session to price them — the S&P's low came late and the close was in the lower half of the range.

11 Geopolitics

- **▲ Iran declared attacks on ten merchant ships near the Strait of Hormuz on 10 September** — the heaviest declared day of shipping attacks in a war now at day 195. Saudi Arabia's foreign ministry said the **Sidr**, owned by national carrier Bahri, was among the vessels struck in transit. This is the single fact behind Thursday's crude move.
- **▲ Houthi forces have claimed attacks on Saudi Aramco's Jazan refinery**, a 400,000 barrel-a-day facility on the Red Sea coast, striking four southern Saudi cities, wounding 73 and igniting oil facilities; satellite imagery showed heavy smoke over the site. Attribution is the Houthis' own claim.
- **▼ Saudi Arabia is striking back at scale.** Houthi media reported 32 Saudi air strikes across Marib, al-Jawf, Taiz and Hodeidah on 9 September, with a further salvo of roughly 40 reported on 10 September. Both figures come from parties to the conflict and are not independently verified.
- **◆ Iran has denied holding direct talks with the United States on reopening the Strait.** That denial is the reason the risk premium is not fading: the market has no diplomatic off-ramp to price.
- **◆ The domestic transmission is now political.** US diesel is at a record **\$5.94 a gallon** and regular petrol at **\$4.15** against \$2.98 before the war. Midterm elections are eight weeks away, which constrains the fiscal response and raises the odds that the burden falls on monetary policy.
- **◆ Hormuz flows remain far below normal**, and stronger Chinese crude buying is tightening an already constrained physical market. Refinery outages in Russia and reduced refining activity elsewhere are amplifying the product-side squeeze — which is why RBOB (+5.69%) and diesel are outrunning the crude benchmarks.

12 Overnight setup — what Asia opens into

INSTRUMENT	06:13 GMT+8	CHANGE	VOLUME	NOTE
ES — E-mini S&P	7,601.25	+0.04%	783	Settle 7,598.50. Inside the spread.
NQ — E-mini Nasdaq	29,143.00	+0.03%	464	Settle 29,135.25.
YM — E-mini Dow	52,095	-0.63%	—	Settle figure only; no live print returned at 06:13.
RTY — E-mini Russell	2,891.00	-0.08%	151	Settle 2,893.40. Only equity future lower.
USD/JPY	154.527	+0.07%	1,983	73 minutes of session. Yen bullish TREND per Hedgeye.
USD/KRW	1,348.67	+0.65%	—	Previous close, ~24h old. Weakest print of that session.
USD/TWD	31.6437	+0.60%	—	Previous close, ~24h old. Range 31.451-31.689.
USD/CNH	6.71380	-0.004%	1,949	0.16% from a 52-week low — strongest renminbi in a year.
EUR/USD	1.16081	-0.03%	1,451	73-minute range 1.16054-1.16114. Noise.
Gold (spot)	4,322.45	+0.10%	—	Futures reopened \$45 lower on 201 lots.
Silver (spot)	63.574	+0.01%	—	Futures settled -5.42%.
Copper (spot)	6.4084	+0.07%	133	Futures settled -4.95% from a record two days ago.
WTI crude (CL1)	104.05	+1.53%	1,769	Above the whole settle-session range.
Brent (BZ1)	109.28	+1.53%	144	Also above the settle range.
Bitcoin	77,126	-1.49%	—	Genuinely live. 2.8% above the \$75k TRADE line.
Ether	2,459.10	-0.36%	—	Session low 2,405.94 held. 48% below its 52-week high.

Every level in this table was captured at 06:12:59 GMT+8 except USD/KRW and USD/TWD, which returned identical values on two pulls five minutes apart and are therefore Thursday closes carried forward, and the YM row, which is a settle. Spot metals and FX majors rolled into a new session at 05:00 GMT+8, so their change figures cover roughly 73 minutes and are not day moves.

- **The US hands Asia a semiconductor problem, not an index problem.** SOX -2.66%, SOXX -2.74%, SMH -2.44% against an S&P down 0.58%. Korea and Taiwan reprice that directly — and USD/KRW closed at its weakest of the session, so the currency will not cushion it.
- **Previous Asian closes for reference:** Nikkei **65,270.88 (+0.20%)**, Hang Seng **24,954.48 (-1.27%)**, KOSPI **7,033.93 (-0.25%)**, Shanghai Composite **3,934.40 (-0.43%)**, ASX 200 **8,819.40 (-1.03%)**, Sensex **74,902.59 (+0.19%)**. All are marked as previous closes; none has traded since.
- **Japan is the cleanest set-up.** The Nikkei rose on Thursday while everything else fell, USD/JPY is stable, and Japan imports essentially all of its crude. A market that ignored a 6.7% oil move once now has to face it a second time with WTI another \$1.57 higher.
- **Korea is the instrument most likely to move.** KOSPI sits near the immediate-term TRADE line Keith described as a trip wire — hold and it accelerates up, break and it accelerates down — and it opens into the worst semiconductor tape in a fortnight and a won at session lows. He deliberately holds no position either way.
- **Europe closed weak and closed badly.** DAX **-0.84%** finished at 25,361.15, which was *exactly* the day's low; Euro Stoxx 50 -0.68%, FTSE 100 -0.57%, CAC 40 -0.49%. Closing on the low in Frankfurt is the strongest single piece of momentum evidence in the overnight tape.
- **The single instrument most likely to move today is crude**, and the second is the two-year note at 20:30 GMT+8. Everything else is downstream of those two.

13 AI watch

- **Oracle's \$664bn remaining performance obligation is the largest single number in the AI trade**, and it beat a \$630.6bn consensus. It is also a promise rather than revenue: FY27 guidance is "at least \$90bn", so the backlog is more than seven years of current run-rate revenue.
- **Roughly \$660-690bn of hyperscaler capex is committed for 2026** — Amazon around \$200bn, Alphabet \$175-185bn, Microsoft \$120bn or more, Meta \$115-135bn, Oracle \$50bn. That is being financed into a market where LQD and TLT both printed 52-week lows on Thursday. The cost of the AI build is now rising while the build accelerates.
- **AI-related issuance already accounts for more than \$1.5tn of new corporate borrowing** and is cited as a direct contributor to upward pressure on Treasury yields. The AI trade and the bond trade are no longer separable.

- **Nvidia's financing commitments keep growing** — up to \$100bn into OpenAI against a 10GW deployment programme, plus up to \$105bn backing an Ohio data centre covering an initial 4.25GW with an option on 3.75GW more. Vendor financing at that scale is a balance-sheet story wearing a demand-story costume.
- **Memory is where the market is expressing its doubt.** Micron -4.90% , Sandisk -4.06% , Western Digital -4.43% on no news. These are the names whose valuations depend most directly on the discount rate, and the discount rate moved 15bp on Thursday.
- **Meta's Muse agent remains the only direct consumer monetisation of the AI capex cycle** at \$20 and \$100 monthly tiers, launched Wednesday. Meta gave back 1.42% on Thursday; the durability of that pricing is the thing to track.

14 Beyond the markets

- **Diesel at a record \$5.94 a gallon is the number that will matter longest.** Petrol is what voters see; diesel is what moves every parcel, pallet and grocery in the country, and it feeds through to core goods with a lag of months. The 1.1% jump in final-demand goods prices is the first instalment.
- **The Fed is in blackout until 17 September**, so between now and the decision there will be a CPI print, a quad-itching set-up and no official guidance whatsoever. Whatever the market decides today, it decides alone.
- **A \$1tn deficit-funded programme paying \$5,000 per American is live in the political debate** — it is what Keith McCullough's Early Look is built around this morning. Whatever its merits, it lands on a bond market at cycle-high yields eight weeks before a midterm.
- **The three-month bill at 3.952% is the quietest important number in the brief.** It is 19.7bp below its own 52-week high while every longer tenor makes new ones. That is the market saying the Fed is behind, not that the Fed is wrong.
- **Sandisk is up more than twentyfold from its 52-week low of \$82.28** and fell 4.06% on Thursday without a headline. Positions built on that kind of move are the ones that get sold first when the discount rate turns.
- **Netflix at \$76.01 is 39% below a 52-week high of \$124.86** and was effectively unchanged on the day. The most defensive megacap consumer subscription in the market has stopped being a source of information.

15 Appendix — stock cards

AAPL · APPLE INC.

326.57 ▲ 3.56%

Cap \$4.77tn · 52wk 229.02–344.57 · 5.2% off high · Vol 70.0m vs 44.7m avg · TRADE line ~314 (Macro Show) · Next catalyst: US CPI today 20:30 GMT+8

The only large-cap that behaved as though the oil shock were not happening. The foldable **iPhone Duo**, the first launch under CEO John Ternus, added roughly \$164bn of market value in a session where the index fell. It reclaimed and held the ~314 line Keith used on air as a worked example of accelerated selling below TRADE reversing above it.

ORCL · ORACLE CORPORATION

152.94 ▼ 5.38%

Cap \$440.5bn · 52wk 114.50–329.50 · 53.6% off high · Vol 55.0m vs 28.3m avg · After hours 159.58 (+4.34%) at 18:08 ET

Beat on EPS (\$1.92 vs \$1.74), revenue (\$19.35bn vs \$19.14bn) and backlog (\$664bn vs \$630.6bn), and guided FY27 to \$8.10 on at least \$90bn. The regular session was a capitulation on double average volume into the print. CNBC reported a 7% extended-hours gain against our 4.34% capture — the direction is not in doubt, the decimal is.

NVDA · NVIDIA CORPORATION

218.36 ▼ 2.37%

Cap \$5.26tn · 52wk 164.27–236.54 · 7.7% off high · Vol 102m vs 146m avg · Next catalyst: FOMC 17 Sep 02:00 GMT+8

The world's largest company fell 2.4% on volume 30% below average, which is a valuation adjustment rather than a liquidation. Its vendor-financing commitments — up to \$100bn into OpenAI and up to \$105bn behind an Ohio data centre — are now being underwritten in a credit market printing 52-week lows.

INTC · INTEL CORPORATION

100.32 ▼ 5.57%

Cap \$530.3bn · 52wk 24.05–142.35 · 29.5% off high · Vol 96.3m vs 89.9m avg · Closed near the low at 99.34–103.23

Worst performer among the large semis and the only one to break a round number, closing barely above \$100 after trading below it. Still more than four times its 52-week low. No company-specific catalyst was findable; this is the rate move landing on the least profitable balance sheet in the group.

MU · MICRON TECHNOLOGY**977.41 ▼ 4.90%**

Cap \$1.10tn · 52wk 153.21–1,255.00 · 22.1% off high · Vol 26.1m vs 25.9m avg

A trillion-dollar memory company that has fallen 22% from its high on ordinary volume and no headline. Micron, Sandisk (–4.06%) and Western Digital (–4.43%) moved together, which makes this a duration trade rather than a demand signal — the memory complex has the longest cash-flow tail in semis.

AMD · ADVANCED MICRO DEVICES**503.60 ▼ 3.36%**

Cap \$822.1bn · 52wk 149.85–584.73 · 13.9% off high · Vol 16.0m vs 17.3m avg

Held its ground better than Intel or the memory names and is still up more than threefold from its 52-week low. Hedgeye removed its short AMD option-income expression on 9 September, so the firm carries no direct position into this drawdown.

META · META PLATFORMS**644.38 ▼ 1.42%**

Cap \$1.64tn · 52wk 520.26–790.80 · 18.5% off high · Range 642.14–663.50, closed near the low · Hedgeye: LONG

Gave back part of Wednesday's 6.55% Muse-launch move and closed in the bottom fifth of a wide range. Muse remains the only direct consumer monetisation of the AI capex cycle at \$20 and \$100 tiers. Hedgeye flipped this from short to long in early September and it is now two sessions of giveback into that position.

GOOGL · ALPHABET CLASS A**332.60 ▲ 0.59%**

Cap \$4.06tn · 52wk 235.84–408.61 · 18.6% off high · Vol 23.5m vs 25.2m avg · Hedgeye: SHORT

Second-best Mag7 performer, and Hedgeye is short it having exited a long and reversed in early September. Two consecutive sessions of the short being offside. The stated rationale for the flip was signal direction rather than the search-disruption narrative, which makes the level rather than the story the thing to watch.

16 About this edition

- **Covers** — the US cash session of Thursday 10 September as settled (16:00 ET = 04:00 GMT+8), the after-hours tape through 18:13 ET, the Globex session to 06:13 GMT+8, and the full Hedgeye evening publication set of 10 September ET.
- **Captured** — two pulls, **06:08:03–06:08:05** (96 instruments, TradingView bulk scan, 2.3 seconds) and a targeted second pull at **06:12:59** for futures, FX, spot metals and crypto. Total window 4m 56s, inside the ten-minute standard. Divergences are reconciled in section 18.
- **Unusual this run** — Yahoo Finance returned nothing (0 of 62, HTTP 429 circuit breaker in 2.3 seconds), so machine capture is single-sourced. Cross-validation was recovered by hand against wire and vendor copy; see section 18.
- **Settled vs live** — cash equities, Treasury yields, VIX, DXY, USD/KRW and USD/TWD are Thursday settles, the oldest roughly 24 hours old and the equity closes 2h 13m old at capture. Index futures, energy, metals futures, FX majors and crypto are live prints. Spot metals and FX majors rolled at 05:00 GMT+8 so their change figures cover ~73 minutes; index futures rolled at 06:00 so theirs cover ~13 minutes. Neither is a day's move and both are labelled ♦ where shown.
- **Hedgeye edition** — full subscriber access reached. The live risk-range set is the Early Look "**Betting \$1T On Inflation Accelerating**" by **Keith McCullough**, published 07:39 ET / 19:39 GMT+8 on 10 September; Friday evening's Early Look supersedes it at roughly 19:30 GMT+8 tonight. Also read: The Macro Show summary notes (10 Sep), the ETF Pro real-time update (10 Sep), Capital Allocation Pro Key Callouts (10 Sep), Signal Strength Stocks (9 Sep) and the Portfolio Solutions daily ETF re-rank (10 Sep). Band diffs are against the archive state file, which holds the 9 September Early Look bands, because the Early Look category page does not paginate.
- **Quad path** — US monthly **Quad 2**, US quarterly **Quad 4** (seven days old), global **Quad 3**. **No forward path notation was seen, for the fifth consecutive edition.** Absence of a printed path is not evidence the path is unchanged.
- **Not available** — Yahoo Finance entirely; the MOMO Tracker, Crypto Quant, KM's Top 3 and Chart of the Day did not appear in the feed this run; NASDAQ:IGV and AMEX:OIH remain outside the capture universe for a sixth edition; the Macro Week Summary Notes PDF page 2 carrying the Quad path; the after-hours reaction to Adobe's results.

Index closes and point changes cross-checked against this wire copy.

Commodities, geopolitics and AI. CNN Business and Fortune for crude and fuel prices, Washington Times for the diesel record, Al Jazeera and CNBC for the Strait of Hormuz and Jazan refinery attacks, GlobalSecurity.org's Iran War day-195 update for the shipping-attack count, and OpenAI, NVIDIA newsroom, CNBC and Futurum for AI capex and financing figures.

18 Data-confidence

CROSS-CHECKS PASSED

- **The capture.py reconciliation is empty and that is not a clean result.** TradingView returned 96 of 96 instruments in 0.5 seconds; Yahoo returned 0 of 62 and aborted on a five-consecutive-429 circuit breaker in 2.3 seconds. The printed table reads 0 match / 0 minor / 0 divergent / **57 single-sourced**. There are no divergent rows to resolve *because no second machine source ran*, not because the numbers agreed. This is the ninth consecutive Yahoo failure.
- **Manual wire cross-check recovered validation on the rows that matter.** Wire and vendor copy independently confirmed the S&P at **7,591.70 (-0.58%)**, the Dow at **52,064.10 (-316.56, -0.6%)** and the Nasdaq Composite at **26,081.72 (-0.65%)** — all matching the capture to the decimal. WTI's settle of **\$102.48, +6.7%** and Brent's **\$107.63** matched to the cent.
- **Futures-to-cash basis confirms every equity settle.** ES 7,598.50 against SPX 7,591.70 is +6.80 points, 0.090%; YM 52,095 against DJI 52,064.10 is +30.9, 0.059%; RTY 2,893.40 against RUT 2,890.95 is +2.45, 0.085%. Three normal bases in a tight cluster; none of these rows is a mislabelled intraday print.
- **Cash index arithmetic is self-consistent.** S&P: $7,591.70 + 44.66 = 7,636.36$ prior close, which matches the level carried in the archive state file exactly. VIX: $17.85 - 1.38 = 16.47$ prior close, also an exact match to the state file. Dow: $52,064.10 + 316.56 = 52,380.66$. Two independent continuity checks against yesterday's edition passed.
- **Yield moves were derived from the captured percentage changes and cross-checked against the captured opens.** 10-year 4.961 from 4.845 is +11.6bp, and the captured open of 4.847 agrees within 0.2bp; 2-year 4.586 from 4.436 is +15.0bp against a captured open of 4.434, agreeing within 0.2bp. Curve arithmetic follows: 2s10s 37.5bp from 40.9bp, 2s30s in 7.7bp.
- **The 52-week-high claims were checked field by field.** For the 2, 5, 10 and 30-year, the captured intraday high equals the captured 52-week high to the last decimal in every case (4.590/4.590, 4.765/4.765, 4.965/4.965, 5.373/5.373). The same test confirms fresh 52-week lows for LQD (low 104.325 = 52wk low) and TLT (80.665 = 52wk low), and a fresh 52-week high for XLE (66.17 = 52wk high).
- **The two-pull design resolved the settle-versus-live ambiguity rather than assuming it.** Instruments that returned identical values five minutes apart (DXY, USD/KRW, USD/TWD, all Treasury series, VIX) are settles; those that moved (ES, NQ, RTY, CL1, BZ1, GC1, SI1, FX majors, crypto) are live. Every row is labelled accordingly rather than presented uniformly.

KNOWN CONFLICTS AND WEAK MARKS

- **Brent's percentage change is disputed; its level is not.** The capture gives +6.34% on NYMEX:BZ1! and Energy Intelligence reports +5.9%; both give a settle of exactly \$107.63. The 0.44pp gap is almost certainly a different prior-settle reference between the Last Day Financial contract and the front-month. The level is solid; the percentage should be treated as approximate.
- **Oracle's after-hours move is the weakest headline mark in the brief.** Our 18:08 ET capture shows \$159.58, +4.34%; CNBC reported roughly +7%. Both are printed in section 9. A single post-market field from a single source, taken at one instant during a fast-moving reaction, cannot be reconciled — the conclusion (Oracle beat and the stock rose) is robust, the decimal is not.
- **The overnight gold futures print is thin enough to distrust.** GC1 settled 4,407.30 and the 06:13 print is 4,362.00 — a \$45.30 gap — on **201 lots**. Silver shows the same shape (64.927 to 64.10) on 92 lots. Both are directionally consistent with the rate and dollar move and with each other, but a two-figure gap on two hundred contracts is not a market level and should be verified before it is acted on. The spot series, which did not gap, is the safer mark.
- **Spot-versus-futures basis is wide across the metals and is doing real work in the risk-range table.** Gold spot 4,321.74 against futures 4,407.30 is a 1.98% basis; silver 63.558 against 64.927 is 2.15%; copper 6.4124 against 6.5475 is 2.11%. Measuring copper on futures instead of the spot series Hedgeye names would report it at roughly -1% of band rather than **-46%**, and gold at 30% rather than **10%**. The spot readings are correct by Hedgeye's own definition, but the two series disagree about how broken these markets are and that disagreement is unresolved.
- **USD/KRW and USD/TWD are stale by roughly 24 hours** and their quoted changes belong to Thursday's Asian session, not to this morning. They are printed because the level Korea and Taiwan reopen into is genuinely useful; the change figure beside them is not a live move. DXY at +0.31% is likewise a Thursday settle from an index series, which sits awkwardly beside FX majors showing near-zero 73-minute changes — the two are not measuring the same window and should not be read as a single FX picture.
- **Hedgeye's published TREND signals and the levels disagree, and the brief does not resolve it.** The S&P is below its band floor with a bullish signal; gold is at 10% of band with a bullish signal; the VIX is above its ceiling for a second session with a bearish signal. Signals are designed to lag levels, so this is not an error in the data — but any inference drawn from the signal column this morning is weaker than the inference drawn from the position column.
- **The XLC attribution is an inference, not a finding.** Communication Services rose 0.61% while Meta fell 1.42% and Alphabet rose only 0.59%. The conclusion that breadth beneath the megacaps drove it follows from arithmetic, but the constituent-level data to prove it was not pulled.
- **Market-implied hike probabilities are quoted from reporting, not from the futures strip.** The ">73% after PPI" and "roughly 62% a month ago" figures are as reported and were not recomputed from fed funds futures this morning.

KNOWN GAPS

- **Yahoo Finance was unavailable for the ninth consecutive run.** With it goes the multi-day daily-bar context used for week-on-week comparisons, so every change figure in this brief is a single-session or partial-session move with no weekly frame.

- **Four Hedgeye publications that would carry position changes did not appear in the feed this run** — the **MOMO Tracker**, **Crypto Quant**, **KM's Top 3 / From The Desk** and **Chart of the Day**. These are the specific publications through which a position change would have been disclosed. **Their absence is not evidence that no position change occurred.** The only change captured is the ETF Pro removal of long IPAY.
- **The forward Quad path remains unread for a fifth consecutive edition.** It sits on page 2 of the Macro Week Summary Notes PDF behind a separate link, and the printed dashboard is still dated 4 September — seven days old. The quarterly Quad 4 read is carried forward from that stale dashboard and now contradicts the monthly Quad 2 read. No path notation is asserted here.
- **IGV and OIH are still outside capture.py's universe** for a sixth edition. Hedgeye publishes bands for both daily, ranks Software #2 and Energy #1 by signal strength, and is long OIH — so the two rows the firm cares most about are the two this brief cannot measure.
- **Adobe's after-hours reaction was not captured.** The results and guidance are reported from press copy; the price response is not, because ADBE is not in the capture universe and the release landed after the second pull.
- **Asian and European cash markets are closed.** Every level in the previous-closes list is a settle from Thursday and none has traded since. There is no live Asian tape at this hour and section 12 does not pretend otherwise.
- **Two calendar items are unconfirmed** — University of Michigan preliminary sentiment today and US August retail sales on 16 September — both taken from secondary calendars and not verified against the releasing agency. FOMC dates, quad witching and the CPI release were verified.

TIMING & UNVERIFIED

- **Capture window 06:08:03 to 06:12:59 GMT+8, a spread of 4 minutes 56 seconds**, inside the ten-minute standard. The run fired at 06:07 against a nominal 06:00 schedule, a seven-minute offset with no material consequence: Globex had already reopened at 06:00 and FX at 05:00, so both were live.
- **Age of the stalest rows.** USD/KRW and USD/TWD are approximately **24 hours** old. Asian and European index closes are **13 to 17 hours** old. US cash equity closes, Treasury yields, VIX and DXY are **2 hours 13 minutes** old. Futures settles are **1 hour 13 minutes** old. Only crude, Brent, the equity futures, FX majors, spot metals and crypto are live.
- **Two change figures in this brief cover partial sessions and are not day moves.** Spot metals and FX majors carry roughly **73 minutes** of trading; index futures carry roughly **13 minutes**, on volumes between 151 and 1,769 lots. A 0.04% move on 783 contracts is inside the spread and is noise, not information. Every such row is marked ♦ or carries its window in the change cell.
- **What has moved since the capture, and what will supersede it.** Crude is still rising — it was above the entire settle-session range at 06:13 and there is no reason to assume it stopped. The Hedgeye risk ranges will be superseded by tonight's Early Look at roughly **19:30 GMT+8**. Every level in section 1 will be stale before Asia's lunch break.
- **The single largest scheduled repricing event is 13 hours 47 minutes after capture.** US August CPI at 20:30 GMT+8 will move the two-year note, and through it everything in sections 1, 3, 4 and 7. Nothing in this brief anticipates that outcome.
- **Verify live prices before acting on anything in this document.** It is a pre-market brief assembled from a five-minute capture window and it is information only, not investment advice.
