Daily Need to Know

Monday, 10 August 2026 · Pre-market brief for Anne Wong

COVERING. The **Friday 7 August** US cash session as settled — this is a Monday brief, so the weekend is a real part of it, not padding. Also covered: the Friday after-hours tape, the overnight FX, metals and crypto marks, and the full weekend news flow through Sunday. Live prices captured in a tight window, **06:15–06:40 GMT+8** on Monday 10 August. US cash is shut. Globex reopened at **06:00 GMT+8** (18:00 ET Sunday) — roughly twenty minutes before capture — and no quote vendor consulted had refreshed off Friday's settle, so the index futures printed below are **Friday settles, not live**. That is stated again in Data-confidence and it matters. Asian cash has not opened: Tokyo and Seoul at 08:00–08:30, Hong Kong 09:30, India 12:15.

EDITION. PUBLIC EDITION. The logged-in Hedgeye feed was not reachable from this run — the Claude in Chrome browser tools are not attached to a scheduled cloud session, so `app.hedgeye.com/feed_items/all` could not be opened and no Early Look, Macro Show, MOMO Tracker, KM's Top 3, Real-Time Alert or Risk Range table was read. **No Hedgeye risk-range levels appear anywhere in this brief.** Section 4 is rebuilt from publicly visible Hedgeye material — the two most recent public Chart of the Day items, both dated March 2026 and both carrying **#Quad3** — plus a Quad read derived from Friday's own data and labelled throughout as our inference, not Hedgeye's published call. The whole gap is recorded under KNOWN GAPS. Absence of a Hedgeye position change in this brief is *not* evidence that there was none.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — SETTLED CLOSE, FRI 7 AUG, 16:00 ET (04:00 GMT+8 SAT)			
S&P 500	7,757.64	▲ +47.68 +0.62%	Record close. Range 7,719.19–7,763.08; settled 38.45 pts off the low, 5.44 off the high — 87.6% up the day's range . Still 0.46% below the 52-week intraday high of 7,793.68. Volume 2.72bn.
Nasdaq Composite	26,690.62	▲ +342.26 +1.30%	Twice the S&P's move. Software did the work, not semis-only. Best five-day run since April on every source consulted, though the exact weekly figure is disputed (see Data-confidence).
Dow Jones Industrial	54,036.93	▲ +151.83 +0.28%	Half the S&P. The Dow's price-weighting has no software and heavy energy/financials — both of which fell. Holds 54,000, first taken on 4 August.
Russell 2000	3,034.49	▲ +32.95 +1.10%	Small caps outran the Dow by 82bp. Rate-sensitive: homebuilders, mortgage originators and regional lenders rallied on the front-end move.
Philadelphia SOX	12,060.41 ‡	◆ -118.85 -0.98% ‡	Unverified. The only ^SOX quote obtainable was stamped 10:34 ET — mid-session, not the close — and its direction contradicts everything else. SOXX ETF closed \$543.27, +2.02% (4:00 ET stamp). Treat semis as up ~2% ; the index print is stale.
US INDEX FUTURES — FRIDAY SETTLE, 16:59 ET. NOT LIVE: GLOBEX REOPENED 06:00 GMT+8, VENDORS HAD NOT REFRESHED AT CAPTURE			
ES (E-mini S&P, Sep 26)	7,779.75	▲ +45.00 +0.58%	Settled 22.11 above S&P cash — a normal positive carry basis, not a risk signal. Friday's settle; the Sunday-evening print is unknown as at capture.
NQ (Nasdaq 100, Sep 26)	29,834.75	▲ +346.50 +1.18%	Friday settle. Underperformed the Composite by 12bp, so the breadth in tech sat outside the top 100 names.
YM (Dow, Sep 26)	54,152.00	▲ +139.00 +0.26%	Friday settle, 115 pts above cash. The laggard of the four, consistent with the cash tape.
RTY (Russell 2000)	3,041.60	▲ +32.50 +1.08%	Friday settle, 7.11 above cash. Basis and cash change agree to within 2bp — a clean cross-check.
US TREASURIES — OFFICIAL PAR YIELDS, CLOSE 7 AUG (TREASURY DEPARTMENT), CHANGE VS 6 AUG			
10-year	4.65%	▼ -4 bp	From 4.69%. A -23k payroll print bought four basis points at the belly-to-long end. That is a small move for the size of the miss — the bond market did not treat this as a recession signal.
30-year	5.19%	▼ -3 bp	From 5.22%. Above 5% since the energy shock. The long end is the price of the inflation problem and it barely moved.
5-year	4.35%	▼ -5 bp	From 4.40%. 2s were the biggest mover at -6bp to 4.19% — the hike premium came out of the front end, exactly where it should.
13-week bill	3.87%	▼ -3 bp	From 3.90%. Sits 32bp below the 2-year and 132bp below the 30-year. The curve is steeply positive from 3m out — not a recession curve.
COMMODITIES — FRIDAY SETTLE, 16:59 ET; SPOT MARKS FLAGGED WHERE THEY DIFFER			
WTI crude (Sep 26)	\$78.18	▲ +0.89 +1.15%	Rose on Iran's restrictive Hormuz draft. Energy <i>equities</i> fell the same day — see \$2.5.
Brent (last-day fin.)	\$83.55	▲ +1.06 +1.29%	Down 33.7% from the \$126 crisis peak struck in the March closure. The tape is pricing a Hormuz reopening, not a barrel shortage.
Natural gas (Sep 26)	\$2.6620	▲ +0.0220 +0.83%	Went along quietly for the ride. US gas is structurally insulated from Hormuz; the move is weather and storage, not geopolitics.

ASSET	LAST	CHANGE	NOTE
RBOB gasoline (Sep 26)	\$2.9853	▲ +0.0468 +1.59%	Outran crude by 44bp. Crack widening into the back half of driving season — the pump, not the wellhead, carries this CPI print.
Gold (Dec 26)	\$4,399.70	▲ +100.10 +2.33%	The single biggest move on the board. A hundred dollars in a session with the S&P at a record. Spot marked \$4,375.80 (+1.77%) — a \$23.90 contango, normal for a December contract.
Silver (Sep 26)	\$63.50	▲ +1.89 +3.07%	Spot marked \$64.69, above the September future. That is backwardation — physical tightness, not a financial-demand story. The most interesting print of the day.
Copper (Sep 26)	\$6.59	▼ -0.12 -1.76%	The one commodity that fell, and it fell hard. Copper is the growth metal; gold and silver are the debasement metals. They separated by over 400bp in a session.
FX AND CRYPTO — MIXED VINTAGE, EACH MARKED			
DXY dollar index	99.638	▲ +0.10%	Live, 10 Aug. Friday settled ~99.56, -0.37%. So the dollar has clawed back roughly a quarter of Friday's loss over the weekend. Sub-100 remains the line.
USD/JPY	157.745	▼ -0.704 -0.44%	Yen firmer on the US front-end move. Still the wrong side of 157. Tokyo opens into a stronger yen and a two-day AI-led Nikkei decline — an unhelpful pairing for exporters.
USD/KRW	1,407.90	▼ -15.30 -1.08%	Friday close. Won up 6.53% in a month — the largest EM Asia FX move on the board. Seoul opens into a materially stronger currency.
VIX	14.90	▼ -0.25 -1.65%	Made a new low for the week on the day the labour market contracted. Implies a ~0.94% daily move; Friday's realised range was 0.57% . Nobody paid for protection into a CPI week.
Bitcoin	\$64,971.76	▲ +49.05 +0.08%	Live at capture. Cap \$1.305tn. Flat while equities made a record and gold added 2.3%. Bitcoin is not trading as debasement insurance in this cycle; gold has taken that job.

Colour key: ▲ green = up ▼ red = down ◆ amber = unverified, disputed or stale. The glyph always tracks the number printed, not its interpretation — for Treasuries a red ▼ is a falling yield (a bond rally), and for FX it is a falling quote (USD/JPY down = yen stronger). ‡ = mark we could not corroborate; see KNOWN CONFLICTS. Reconciliation: S&P prior close 7,709.96 + 47.68 = 7,757.64 ✓. Cash equities, Treasuries, commodities and index futures are Friday marks; DXY, VIX-adjacent commentary, Bitcoin and Ether are live at 06:15–06:40 GMT+8 Monday. Nothing in this table mixes a Friday mark and a Monday mark inside one row without saying so.

TL;DR

The US economy shed **23,000** jobs in July against a consensus of **+80,000**, and the S&P 500 closed at a record. That is not a contradiction: this market was pricing a September rate *hike*, and the payroll miss took the hike away. Futures flipped September from likelier-than-not to worse-than-even. The tell is that the index settled **87.6% up its daily range** — buyers held into the bell, which is a continuation pattern, not distribution. The tell against it is that gold added **\$100.10**, silver went into **backwardation**, copper fell **1.76%** and the 30-year barely moved at **5.19%**. Equities bought the growth story; the metals and the long bond bought the inflation story. **Wednesday's July CPI at 20:30 GMT+8 settles the argument** — consensus 3.4% headline, 2.5% core.

2 The big picture — what it means

- The rally was bought on bad news, and the bad news was the labour market.** July non-farm payrolls came in at **-23,000** against a consensus near **+80,000** — a swing of over 100,000 against the forecast. The prior two months were revised down by a combined **103,000**. The unemployment rate *fell* to 4.1% from 4.2%, which sounds reassuring until you see why: labour-force participation dropped to **61.4%**, a five-year low. The rate improved because people left, not because they were hired. Average hourly earnings decelerated to **3.2% y/y** against 3.5% expected. Every component of that report points the same direction.
- This is a hike scare unwinding, not a cutting cycle starting.** Understand the starting point or the price action makes no sense: three FOMC participants backed a hike at the July meeting, and going into Friday the market put a September increase at better than even. Reuters reported that rate futures "flipped the odds of a rate hike at the September 15 to 16 FOMC meeting from likelier-than-not to a worse-than-even chance." Fed Governor **Lisa Cook** has said she would support rate increases if inflation does not fall soon. Richmond's **Tom Barkin** called the labour market balanced but weak, with employers in "wait-and-see mode" and a "zero-ish workforce growth environment." Capital Economics' Thomas Ryan said a "meaningful upside surprise" in the inflation data would now be needed to get a September hike. Morgan Stanley's Ellen Zentner put it plainly: cooler labour data alone will not stop the calls for increases if prices disappoint. Nobody credible is talking about cuts.
- Two things about the record close are worth more than the record itself.** First, the index settled **87.6% up its intraday range** (close 7,757.64, low 7,719.19, high 7,763.08) — buyers were present into the bell. Second, and less comfortable: 7,757.64 is a record *close*, but the 52-week intraday high is **7,793.68**. The index remains **0.46% below** its own high-water mark. A record close set beneath an unbroken intraday high is a market grinding, not a market breaking out.
- The best earnings season in five years is happening and almost nobody is leading with it.** Per FactSet as at 7 August: **88%** of the S&P 500 has reported, **86%** beat on EPS against a five-year average of 78%, and **76%** beat on revenue. Blended earnings growth is **+50.4%** — the highest since Q2 2021 — on revenue growth of **+15.0%**, the highest since Q4 2021. Now the inconvenient part: the aggregate earnings surprise of **+29.2%** is the highest FactSet has recorded since it began tracking in 2008, and it is heavily

distorted by investment gains at Alphabet and Amazon. Strip those two out and the surprise is **+10.9%** — still well above the 7.0% norm, but a different number entirely. The forward P/E is **20.0** against a five-year average of 19.9. This market is not expensive on forward earnings. It is expensive on whether those earnings are what they look like.

5. **Energy equities fell while crude rose, and that gap is the Hormuz trade in one line.** WTI added **1.15%** to \$78.18 and Brent **1.29%** to \$83.55 on Iran's restrictive draft plan for the strait. XLE closed **-1.13%**, the worst sector on the board. Equity holders are not paying up for a barrel they believe is temporary. Brent at \$83.55 is **33.7% below** the \$126 peak struck when the strait was shut in March. The energy complex has already priced the reopening; the futures curve is still trading the headlines. If the Oman-brokered arrangement lands, the equities were right and crude has further to fall. If it collapses, the equities are badly offside.
6. **Precious metals are where the regime is being expressed honestly.** Gold added **\$100.10** — 2.33% — in a session when the S&P made a record and the VIX fell. Silver added 3.07% to \$63.50 on the September future while **spot marked \$64.69, above the future**. That backwardation is physical scarcity, not a leveraged financial bid. Meanwhile copper — the metal that needs an economy — fell **1.76%**. Gold and silver up, copper down, in the same session, is not a deflation trade. It is a debasement trade with a growth problem attached.
7. **Bitcoin's silence is the loudest thing on the board.** BTC sits at **\$64,971.76**, up 0.08%, on a day gold added 2.3% and equities set a record — and it does so after a drawdown that public coverage puts at roughly **52% from the cycle high**. Ether at **\$1,913.14** is down on the day. Whatever crypto was supposed to hedge in an era of 3.4% inflation, a shut oil chokepoint and a Fed debating hikes, it is not hedging it. Gold took the mandate and kept it.

3 Rates, currencies & commodities

- **The curve bull-steepened at the front and did almost nothing at the back.** 2s -6bp to 4.19%, 5s -5bp to 4.35%, 10s -4bp to 4.65%, 30s -3bp to 5.19%, 3m -3bp to 3.87%. The whole reaction to a six-figure payroll miss was six basis points at the two-year. A bond market that believed in a growth accident would have moved ten times that.
- **The 30-year at 5.19% is the number nobody wants to discuss.** It has been above 5% since the energy shock and a labour-market contraction did not shift it. Long-end term premium is being set by inflation and supply, not by the cycle. This is the single cleanest argument that the Fed's problem in September is still prices, not jobs.
- **The dollar sold off on Friday and bought some of it back over the weekend.** DXY ended Friday near **99.56**, down 0.37%, and printed **99.638** live on Monday morning GMT+8, up 0.10%. Sub-100 is intact but the weekend gave the bears nothing.
- **The euro is the cleanest expression of dollar weakness.** EUR/USD **1.1562**, +0.32%, at seven-week highs. Sterling **1.3492**, +0.34%. The commodity dollars ran harder — AUD +0.57%, NZD +0.50% — which fits gold and silver rather than copper.
- **Asian FX did the heavy lifting and Korea led it.** USD/KRW **1,407.90**, -1.08% on Friday and **-6.53% over a month**. USD/TWD **32.2507**, unchanged to two decimal places on the day but the TWD is **7.84% weaker year-on-year**. Two of Asia's semiconductor exporters, two opposite currency stories.
- **Yen strength meets a weak Nikkei.** USD/JPY **157.745**, -0.44%. Tokyo closed Friday **-0.12%** having fallen for a second straight session on AI-trade concerns. A firmer yen into a soft tech tape is the least helpful combination for the index Japan is carrying.
- **Gold's move is doing something silver's is not.** Gold's December contract sits \$23.90 above spot — ordinary contango. Silver's September contract sits **\$1.19 below** spot — backwardation. Gold is a financial bid; silver has an inventory problem. UBS is publicly modelling \$5,000/oz gold by mid-2027, per TheStreet's report; that is a house view, not a market price.
- **Copper is the dissident.** -1.76% to \$6.59 while every other metal rallied. If you want one number that argues the growth scare is real rather than a rates story, it is this one.

4 Hedgeye — regime, risk ranges & the Quad path

PUBLIC EDITION — read this before the tables below. The authenticated Hedgeye feed could not be opened from this run. No Early Look, Macro Show, MOMO Tracker, KM's Top 3, Chart of the Day, Crypto Quant, Capital Allocation Pro, Signal Strength or Real-Time Alert published since the previous edition was read. **The Risk Range™ table is therefore not reproduced — in full or in part — and no Hedgeye band, TREND signal or price level appears anywhere in this document.** Carrying forward stale bands was considered and rejected: the last publicly datable Hedgeye macro items are from March 2026 and any band from that vintage would be worse than useless. What follows is a substitute built from public Hedgeye headlines and from Friday's own data, labelled as such at every step.

MACRO DASHBOARD — THE INPUTS THE QUAD FRAMEWORK ACTUALLY TAKES

INPUT	LATEST	PRIOR	DIRECTION	QUAD IMPLICATION
Non-farm payrolls, July	-23,000	-20,000	Decelerating	Growth down — second negative month
Prior 2 months, revision	-103,000	—	Decelerating	Growth down — the trend was worse than reported
Unemployment rate	4.1%	4.2%	Improved on participation	Ambiguous — flatters growth optically
Participation rate	61.4%	higher	Five-year low	Growth down — supply, not demand

INPUT	LATEST	PRIOR	DIRECTION	QUAD IMPLICATION
Avg hourly earnings y/y	3.2%	~3.5% exp	Decelerating	Wage inflation down — the one dovish input
Headline CPI y/y (Wed cons.)	3.4%e	—	Above 2% target	Inflation up vs mandate
Core CPI y/y (Wed cons.)	2.5%e	—	Above target	Inflation up , but less than headline
Brent crude	\$83.55	\$126 peak	-33.7% from peak	Inflation down from the shock — the disinflation hope
30-year Treasury	5.19%	5.22%	Sticky above 5%	Inflation up — term premium refuses to fall
Gold	\$4,399.70	\$4,299.60	+2.33% in a day	Classic Quad 3 leadership

Sources: BLS via wire reporting for the labour data; consensus CPI from TradingKey's week-ahead; Treasury Department for the 30-year; Yahoo Finance for gold. This dashboard is ours, not Hedgeye's — Hedgeye's own nowcast inputs and weightings were not available to this run.

QUAD PATH

Growth decelerating (payrolls negative, revisions negative, participation at a five-year low) with inflation accelerating relative to target (3.4% headline consensus, 30-year pinned above 5%) maps to **#Quad3 — stagflation**. The two most recent publicly visible Hedgeye Chart of the Day items are titled **"#Quad3's Spider Web"** (24 March 2026) and **"#Quad3 Imploding The Mother Of All Bubbles"** (27 March 2026), both authored by Keith McCullough. Those are Hedgeye's own words and they are #Quad3 — but they are **four and a half months stale** and cannot be represented as the current call.

Our inferred path: 3 → 3 → 3, with the caveat that Friday's wage deceleration to 3.2% and Brent's 33.7% retracement from the peak are the two inputs that could rotate this toward Quad 1 if Wednesday's CPI undershoots. **We have no visibility on whether Hedgeye changed its Quad path this weekend, and it may well have.** Anne should treat this paragraph as a placeholder for the real call, not a substitute for it.

RISK RANGE™ TABLE

Not available. Not reconstructed. Not estimated. This section normally carries the full instrument-by-instrument table with immediate-term ranges, TREND signals and our own read of where each live print sits inside or outside the band — and the band-versus-prior-day comparison is the most valuable thing in the section. None of it can be honestly produced without the feed. As a partial and clearly-not-Hedgeye stand-in, here is where Friday's closes sat inside their own observable ranges:

INSTRUMENT	CLOSE	OBSERVED RANGE	POSITION IN RANGE — OUR CALCULATION
S&P 500 (day)	7,757.64	7,719.19 – 7,763.08	87.6% up the range — closed strong
S&P 500 (52-week)	7,757.64	6,316.91 – 7,793.68	97.6% up the range — 0.46% below the high
Philadelphia SOX	12,060.41 ‡	12,048.71 – 12,361.25 ‡	Stale 10:34 ET print; not usable

This is arithmetic on observed highs and lows. It is **not** a Risk Range™, carries no TREND signal, and should not be used as one.

WHAT KEITH ACTUALLY SAID

Nothing quotable was obtainable this morning. No Early Look was reachable, and every Hedgeye insight page consulted returned a headline and a paywall. One public McCullough quote surfaced in search — an Early Look excerpt beginning **"#Quad2 Breakout, It Was"** and referencing 5 of 37 Risk Range™ signals flashing bearish TREND — but its publication date could not be established, and an undated quote about a Quad 2 breakout would be actively misleading printed under a Monday-morning header in a Quad 3 tape. **It is therefore excluded.** House rule: no paraphrase inside quotation marks, and no quote without a timestamp.

5 Mag7 scoreboard

NAME	LAST	DAY		CAP	READ
NVIDIA	\$223.96	▲ +4.97	+2.27%	\$5.42tn	Biggest cap on earth and still the biggest mover of the seven. Cap up 23.9% y/y. Corroborates SOXX +2.02% and kills the stale ^SOX print.
Tesla	\$328.58	▲ +9.05	+2.83%	\$1.30tn	Best of the seven. Highest beta to the front-end rate move and it behaved like it. Smallest cap in the group.
Amazon	\$274.48	▲ +2.22	+0.82%	\$2.96tn	One of the two names whose investment gains inflate the index-wide earnings surprise to +29.2%. Below \$3tn.
Meta Platforms	\$592.10	▲ +2.20	+0.37%	\$1.51tn	Underperformed the S&P. Sits in XLC, which closed +0.06% — the second-weakest sector.
Apple	\$313.33	▲ +0.92	+0.29%	\$4.57tn	Cap up 44.5% y/y — the largest twelve-month re-rating of the seven — on a 0.29% day. Second-largest company in the world.
Microsoft	\$499.99	▲ +0.13	+0.03%	\$3.71tn	Closed one cent below \$500 on a +1.30% Nasdaq day. Cap down 4.9% y/y — the only one of the seven that has shrunk.
Alphabet	\$354.30	▼ -3.45	-0.96%	\$4.33tn	

NAME	LAST	DAY	CAP	READ
Only decliner. Cap up 82.7% y/y — the largest re-rating in the group, and now giving some back. Marked \$354.75 after hours.				

All marks are settled closes, 7 August 2026, 16:00 ET. Combined capitalisation of the seven: **≈\$23.80 trillion**. Market caps are as published by the data provider and move with the share count; treat the y/y percentages as indicative rather than exact. Five of seven beat the S&P's +0.62%; the two that did not — Microsoft and Alphabet — are the second and third largest.

6 Positioning & options

- **The VIX made a new low for the week on the day the labour market contracted.** 14.90, down 1.65%. That is the whole positioning story: nobody bought protection into a payroll shock, and nobody is buying it into a CPI print on Wednesday.
- **Implied volatility is running well above realised and still looks cheap in absolute terms.** A VIX of 14.90 implies a daily move of roughly **0.94%** ($14.90 \div \sqrt{252}$). Friday's actual high-to-low range was **43.89 points on 7,719.19 — 0.57%**. Realised came in at about 61% of implied. Selling that gap has worked; it works until it does not, and the calendar has three tier-one prints in it.
- **The index closed 0.46% below its 52-week intraday high with volatility at the lows.** Markets that grind into a ceiling on falling volatility are markets where hedges have been monetised and not replaced. That is a fragility observation, not a forecast.
- **Volume was 2.72 billion shares on the S&P complex** — a payroll Friday in August, which is neither a conviction number nor a holiday number. The move was not made on heavy participation.
- **Sector dispersion was 262 basis points**, from XLY at +1.49% to XLE at -1.13%. Wide dispersion with a low VIX means the index volatility is being suppressed by offsetting sector moves rather than by genuine calm underneath.
- **What we could not get, and it matters:** no CBOE equity or index put/call ratio, no AAI or II sentiment survey, no CFTC Commitments of Traders positioning, no dealer gamma estimate, no CTA exposure model, and no ODTE volume split. Every positioning statement above is derived from price and volatility alone. Section 6 is thinner than it should be and Anne should read it as such.

7 Sector rotation — leaders & laggards

#	SECTOR (SPDR)	CLOSE	DAY	READ
1	Consumer Discretionary · XLY	\$118.10	▲ +1.49%	Led on the front-end rate move, not on the consumer. Tesla is the single largest contributor.
2	Technology · XLK	\$187.97	▲ +1.42%	Semis and software together. The engine of the +1.30% Composite.
3	Materials · XLB	\$52.86	▲ +1.32%	Precious-metals miners, not the copper complex — copper itself fell 1.76%.
4	Health Care · XLV	\$165.68	▲ +0.75%	Beat the index. The <i>only</i> S&P sector with negative y/y earnings growth this quarter, per FactSet.
5	Utilities · XLU	\$43.61	▲ +0.53%	Bond proxy doing its job on a -6bp two-year.
6	Real Estate · XLRE	\$44.98	▲ +0.38%	Underperformed the index despite the rate move — the long end barely helped.
7	Industrials · XLI	\$185.18	▲ +0.23%	Lagged badly for a cyclical on a risk-on day. Sits with copper on the growth side of the ledger.
8	Communication Services · XLC	\$111.25	▲ +0.06%	Effectively flat. Alphabet -0.96% and The Trade Desk's collapse both sit here.
9	Consumer Staples · XLP	\$85.12	▲ +0.01%	One cent. On a day the labour market contracted, defensives were not bid.
10	Financials · XLF	\$57.60	▼ -0.36%	Fell. A flatter, lower front end compresses net interest margin faster than it helps credit.
11	Energy · XLE	\$57.50	▼ -1.13%	Worst sector — on a day WTI rose 1.15% . The most informative divergence on the board.

All eleven marks are settled closes, 7 August 2026, 16:00 ET, taken from individual security pages with matching timestamps. An aggregated comparison page returned a materially different and internally inconsistent set of figures; it was discarded — see KNOWN CONFLICTS.

- **Leaders:** XLY +1.49%, XLK +1.42%, XLB +1.32%. Two of the three are pure duration plays dressed as equities; the third is the metals trade.
- **Laggards:** XLE -1.13%, XLF -0.36%, XLP +0.01%. Energy and financials — the two sectors that carried the index through the inflation shock — were the two that were sold.
- **The rotation:** money moved out of the inflation winners and into the rate-cut-adjacent, on a day when the rate news was only that a *hike* became less likely. That is an aggressive interpretation of a modest signal, and it is why Wednesday's CPI is dangerous: the positioning has already moved further than the news has.
- **The exception that proves the point:** XLV, the only sector with declining earnings, outperformed seven others. When the tape rewards the weakest fundamental sector, it is trading the discount rate, not the cash flows.

8 Forward — futures & the week ahead

The overnight tape is genuinely young and this brief will not pretend otherwise. Globex reopened at 06:00 GMT+8 — eighteen minutes before the price capture began, and roughly twenty-five before it closed. Every futures venue consulted was still publishing Friday's 16:59 ET settles: ES 7,779.75, NQ 29,834.75, YM 54,152.00, RTY 3,041.60. Those are the levels Sunday evening opened *from*, not the levels it is trading at. What can be said with confidence is that the continuously-traded instruments moved little over the weekend: Bitcoin is flat at \$64,971.76, Ether soft at \$1,913.14, and the dollar index has firmed 0.10% to 99.638 — a small dollar bid, which is a mild headwind for the Asian FX rally rather than a reversal of it. Nothing in the weekend news flow — the Iran-Oman Hormuz negotiation is progressing but unresolved — argues for a gap in either direction. Asia should open into a constructive but unconfirmed handover.

DAY (GMT+8)	KEY EVENTS
Mon 10 Aug	No tier-one US data. Asia opens into Friday's record close: Tokyo/Seoul 08:00–08:30, Hong Kong 09:30, India 12:15. US cash 21:30. Watch the Iran–Oman Hormuz framework for confirmation or collapse.
Tue 11 Aug	CoreWeave (CRWV) Q2 after the US close — capex sustainability and free-cash-flow conversion are the questions, not the revenue line. Lumentum (LITE) FY26 results, data-centre optical demand.
Wed 12 Aug	US July CPI, 20:30 GMT+8 (08:30 ET) — the event of the week. Consensus 3.4% headline y/y, 2.5% core y/y . An upside surprise, particularly in core services, puts the September hike back on the table and reverses Friday's rotation wholesale. Coherent (COHR) Q4/FY26 at 04:30 GMT+8 Thursday.
Thu 13 Aug	US July PPI, 20:30 GMT+8. Matters more than usual: it carries the pipeline read on the energy retracement. Applied Materials (AMAT) Q3 FY26 at 04:30 GMT+8 Friday — the cleanest public read on the AI capex cycle at the equipment layer.
Fri 14 Aug	US July retail sales. After a –23k payroll print and participation at a five-year low, this is the test of whether the consumer has noticed. September FOMC is 15–16 September, so this is the last full data week before the pre-meeting run-in.

*Times converted at ET + 12h (US daylight time). CPI and PPI release times are confirmed against the standard 08:30 ET BLS convention and the TradingKey preview; earnings dates are from company-page calendars and are **secondary-source, unconfirmed against the exchange calendar**. Fed speakers, Treasury auction sizes and non-US releases could not be retrieved this morning — see KNOWN GAPS.*

9 Corporate news

- **The Trade Desk lost more than a fifth of its value in a session** — closed **\$13.80, –\$3.87, –21.90%**, cap down to \$6.48bn. Q2 missed on earnings and revenue and Q3 guidance came in well below consensus. The 52-week high is **\$91.45**: the stock is **84.9% below** it. Multiple downgrades followed. This is the largest single-name destruction of the session and it happened inside the flattest sector.
- **Doximity rose about 81%** on a revenue beat — the largest gain of the day on any screen consulted.
- **Atlassian rose 32.1%** on adjusted operating margin of 36% and guidance raised materially above estimates. It was the anchor of the software rally that drove the Composite's 1.30%.
- **Airbnb rose roughly 16%** on a Q2 beat with raised revenue guidance; gross booking value +16% y/y. Lyft also posted strong results — travel and transport both firm.
- **Cloudflare** beat on revenue at **\$696m, +36% y/y**. **Microchip Technology** raised full-year guidance with sequential sales seen up 7–9%.
- **Storage was the exception inside tech.** Western Digital fell 5.4% *despite* beating, on the outlook; Seagate fell 8% in sympathy. When a beat is sold, the guide is the story.
- **Health care delivered.** Halozyme raised 2026 guidance to adjusted EPS of \$8.65–\$9.00. ResMed posted low-double-digit y/y growth. The FDA approved Replimune's Tudriqev for advanced skin cancer.
- **Consumer was split.** Monster Beverage beat, net sales ex-alcohol +20.8%. Texas Roadhouse posted comparable restaurant sales +6.2%. DraftKings missed on adjusted earnings and guided full-year revenue to \$6.5–6.9bn.
- **Policy moved two groups.** Solar names rallied on White House tariff announcements on polysilicon. MP Materials reported NdPr production **+41% y/y** — rare earths remain a policy trade as much as a mining one. James Hardie raised full-year guidance on demand.
- **Rate-sensitives ran as a bloc:** Zillow, Compass and Rocket all rallied on the front-end move. That is the Russell's +1.10% in three tickers.
- **One item we could not stand behind:** a single source reported SpaceX up 11% on an analyst upgrade. It appeared nowhere else we checked and is not corroborated. Flagged, not relied upon.

10 Macro data

- **July non-farm payrolls: –23,000 actual against +80,000 consensus.** A miss of over 100,000. One source put consensus at +83,000; the difference does not change the conclusion but it is a real discrepancy and is recorded below.
- **Prior two months revised down by a combined 103,000.** The June print now stands at –20,000. Two consecutive negative months is not noise.

- **Unemployment rate: 4.1% actual, 4.2% consensus and 4.2% prior.** The rate *fell* against expectations — and it fell for the wrong reason.
- **Labour-force participation: 61.4%, a five-year low.** This is the line that turns a soft report into a structural one. Barkin's framing — a "zero-ish workforce growth environment" driven by immigration policy and demographics — says the denominator is shrinking faster than the numerator.
- **Average hourly earnings: +3.2% y/y actual against +3.5% consensus.** The single most Fed-relevant number in the release and the one that most supports a hold. Wage-driven services inflation is decelerating.
- **Market-implied September policy: flipped.** Reuters reported rate futures moving a 15–16 September hike from likelier-than-not to worse-than-even. One secondary source put the post-print odds below 57%, another described it as near 50-50 — the sources disagree on the level and agree on the direction.
- **Q2 earnings, per FactSet as at 7 August:** 88% reported; 86% beat EPS (5-yr avg 78%, 10-yr 76%); 76% beat revenue (5-yr 70%); aggregate EPS surprise +29.2%, the highest since FactSet began tracking in 2008 — but **+10.9% excluding Alphabet and Amazon's investment gains**. Blended earnings growth +50.4%, revenue growth +15.0%. Forward 12-month P/E 20.0 against a 19.9 five-year average. Ten of eleven sectors growing y/y; **Health Care is the sole decliner**.
- **Wednesday's consensus, printed now so Thursday's brief can be scored against it:** July CPI 3.4% headline y/y, 2.5% core y/y.

11 Geopolitics

- ▲ **Iran and Oman have agreed vessel-routing coordinates for the Strait of Hormuz.** Per Al Jazeera on 8 August: inbound traffic through a northern lane in Iranian territorial waters, outbound through a southern lane in Omani waters coordinated with Iran. US media reporting describes an interim **60-day** arrangement, extendable, with mine clearance, military-vessel passage and a fee system still under discussion. Foreign Minister **Abbas Araghchi** said the agreement was "very close." Parliament's national security commission confirmed the framework pending approval at "higher levels."
- ▼ **The IRGC says the reopening conditions remain unresolved, and Iran's demands are not small.** Tehran wants the US naval blockade of its southern ports lifted, US military assets withdrawn from the region, Israeli attacks on Lebanon halted, frozen Iranian assets released, and compliance with a June memorandum of understanding that Iran claims Washington has already violated. Araghchi's "very close" and the IRGC's "unresolved" are both accurate descriptions of the same negotiation, and which one is operative is the single largest binary in global markets this week.
- ◆ **Context for the levels, because the retracement is the story.** The crisis began in late February with US and Israeli strikes on Iran that killed Supreme Leader Ali Khamenei; Iran closed the strait with mines, drones and direct attacks on shipping. Traffic fell roughly 70%. Brent crossed **\$100 on 8 March** for the first time in four years and peaked at **\$126**. Regional oil exports fell from about 25 million to 10 million barrels a day. At the April count, some 20,000 mariners and 2,000 ships were stranded in the Gulf; at least 17 merchant vessels were damaged, one tug sunk, two captured, and twelve seafarers were killed or missing. Brent at **\$83.55** today is 33.7% below the peak. *Historical detail here is drawn from a tertiary encyclopaedic source and should be treated as indicative on specifics, not as wire copy.*
- ◆ **A Saudi-Turkey-Pakistan defence pact is reportedly under discussion.** Reported alongside the Hormuz negotiation in Friday's market commentary. Single-sourced in what we could reach; if real, it is a structural realignment of Gulf security and a slow-burn story rather than a Monday one.
- ◆ **Reporting that the US administration is weighing further military action against Iran** appeared in a secondary aggregator headline. We could not reach a wire-service confirmation this morning. Recorded as a claim attributed to that outlet, not as an established fact.
- ▲ **Chinese trade data beat expectations** — the stated driver of Hong Kong's +0.54% on Friday. It is the one piece of the weekend's global macro that is unambiguously constructive for Asia's open.

12 Overnight setup — what Asia opens into

INSTRUMENT	LEVEL	CHANGE	VINTAGE & NOTE
ES — E-mini S&P	7,779.75	+0.58%	Friday settle , 16:59 ET. Globex reopened 06:00 GMT+8; no live print available at capture. Volume not published by the source.
NQ — Nasdaq 100	29,834.75	+1.18%	Friday settle . Volume not available.
YM — Dow	54,152.00	+0.26%	Friday settle . Volume not available.
RTY — Russell 2000	3,041.60	+1.08%	Friday settle . Volume not available.
USD/JPY	157.745	▼ -0.44%	Continuous market; mark taken in the capture window.
USD/KRW	1,407.90	▼ -1.08%	Friday close — the onshore market is shut until 08:00 GMT+8.
USD/TWD	32.2507	+0.002%	Friday close . Effectively unchanged on the day.

INSTRUMENT	LEVEL	CHANGE	VINTAGE & NOTE
USD/CNH	unresolved ‡	—	Two sources gave 7.2386 and (for onshore CNY) 6.7482. That spread is not survivable between CNH and CNY; neither is printed as fact. Onshore USD/CNY 6.7482, +0.08% , is the mark we stand behind.
EUR/USD	1.1562	+0.32%	Seven-week high. Continuous market.
Gold	\$4,399.70	+2.33%	Dec 26 future, Friday settle. Spot \$4,375.80.
Silver	\$63.50	+3.07%	Sep 26 future, Friday settle. Spot \$64.69 — above the future.
Copper	\$6.59	-1.76%	Sep 26 future, Friday settle. The only metal down.
WTI / Brent	\$78.18 / \$83.55	+1.15% / +1.29%	Friday settles. Hormuz headline risk is live over the Asian session.
Bitcoin	\$64,971.76	+0.08%	Live at capture. Cap \$1.305tn.
Ether	\$1,913.14	-0.17%	Live at capture. Cap \$231.26bn.

Previous Asian cash closes — all Friday 7 August, all marked as previous closes, none live: Nikkei 225 **65,606.71, -0.12%**; Hang Seng **25,668.03, +0.54%**; KOSPI **6,258.77, -0.60%**; TAIEX **44,225.91, -0.38%**; ASX 200 **9,263.60, -0.09%**. A second vendor page returned a materially different and older set for these indices; it was discarded — see KNOWN CONFLICTS.

- **The US hands Asia technology and hands it nothing else.** XLK +1.42%, SOXX +2.02%, NVDA +2.27%, Composite +1.30% — against energy -1.13% and financials -0.36%. Asia's semiconductor complex gets the clean handover; its banks and resource names do not.
- **Every major Asian market except Hong Kong closed lower on Friday** — Nikkei, KOSPI, TAIEX and the ASX all fell, because they closed **before** the US payroll print at 20:30 GMT+8. Asia has not yet traded this news at all. The gap between Friday's Asian closes and Friday's US close is the entire opportunity and the entire risk in today's open.
- **Korea is set up to reprice the hardest.** The KOSPI fell 0.60% on Friday waiting for the US jobs report, then got a semiconductor rally and a 1.08% stronger won. Seoul at 08:00 GMT+8 has the largest catch-up to make in the region.
- **Japan is the awkward one.** The Nikkei has fallen two straight sessions on AI-trade concerns, and now receives a +2% US semiconductor session alongside a yen that firmed 0.44%. The tech signal says buy; the currency says the exporters do not get to keep it.
- **Taiwan is the purest read.** TAIEX -0.38% on Friday with the TWD unchanged, into NVDA +2.27% and AMAT +2.21%. No currency noise, no domestic distortion — if the semiconductor handover is real, Taipei is where it shows first and cleanest.
- **The single instrument most likely to move: the KOSPI.** It carries the semiconductor beta, it has the largest gap to Friday's US close, and it has a currency moving 1% in its favour. Second place is gold in Asian hours — a \$100 session rarely stops cleanly at a Friday bell.

13 AI watch

- **Nvidia is reportedly in talks to guarantee up to \$250 billion of financing for OpenAI's infrastructure** — first reported by the Wall Street Journal in late July and picked up by Reuters, CNBC and Al Jazeera. The vehicle is tied to OpenAI's **10-gigawatt Ohio data centre**, with some coverage suggesting total project cost could approach \$500bn. **Not confirmed by either company.** If it lands, it is a chip vendor underwriting its own largest customer's balance sheet — an arrangement whose circularity is the point, and the risk.
- **The 2026 hyperscaler capex estimates now cluster between \$690bn and \$800bn** across independent research houses. These are third-party models, not company guidance, and the spread between them is larger than most companies' entire capital programmes.
- **This week is a concentrated test of that cycle at three layers.** CoreWeave on Tuesday is the neocloud layer — the market wants free-cash-flow conversion, not another capex number. Coherent on Wednesday and Lumentum on Tuesday are the optical interconnect layer. Applied Materials on Thursday is the equipment layer, and is the most sensitive to whether the orders behind the announcements are real.
- **CoreWeave closed \$90.67, +6.26%, at a \$49.47bn cap** going into Tuesday's print. A 6% run into your own earnings raises the bar you have to clear.
- **The dissent is in Tokyo, not New York.** The Nikkei fell for a second consecutive session on Friday specifically on "persistent concerns about the artificial intelligence trade," per Trading Economics' session summary — while US semis rallied 2%. Two markets, one theme, opposite conclusions in the same 24 hours. Asia has been more sceptical of AI capex than America for two sessions running, and Asia has been wrong so far.
- **The number to hold onto: NVIDIA's market capitalisation is \$5.42 trillion**, up 23.9% year-on-year, and is larger than Apple's by \$850bn. The AI trade is no longer a sector call. It is a market-structure call.

14 Beyond the markets

- **American labour-force participation at 61.4% is a demographic and immigration fact wearing a cyclical costume.** Barkin's "zero-ish workforce growth environment" means the economy can print negative payrolls and a falling unemployment rate simultaneously, indefinitely. Every model that reads payrolls as a demand signal is now reading a supply constraint. This will be mis-analysed for months.
- **Twelve seafarers were killed or are missing in the Hormuz closure, and around 20,000 mariners were stranded in the Gulf at the April count.** Brent's round trip from \$126 to \$83.55 will be written up as a commodity story. It was a maritime labour catastrophe first.
- **Microsoft's market capitalisation is down 4.9% year-on-year while Alphabet's is up 82.7%.** Both are in the same three-to-five trillion dollar bracket, both sell cloud and AI, and one has lost value over twelve months in the greatest technology bull market on record. Nobody is writing that headline.
- **The Trade Desk is 84.9% below its 52-week high and still trades on a 16.2x trailing P/E with \$407m of net income.** A profitable, growing, cash-generative company has had five-sixths of its equity value removed inside a year. Whatever this market is repricing, it is not doing it gently.
- **The aggregate earnings surprise of +29.2% is the highest FactSet has recorded since 2008 and it is substantially an artefact of two companies' investment portfolios.** Mark-to-market gains on equity stakes are being counted as operating beats across an index-level statistic that thousands of allocators will quote this quarter without the asterisk. The honest number is +10.9%.
- **Silver in backwardation at \$64.69 spot against \$63.50 futures is a small, boring, technical fact that says the physical market is short metal.** It will be in nobody's morning summary and it is the most information-dense print of the session.

15 Appendix — stock cards

NVDA · NVIDIA CORP

\$223.96 ▲ +4.97 +2.27%

Cap \$5.42tn · 52w range n/a · Close 7 Aug 16:00 ET · Next key date: AMAT read-across Thu 13 Aug; own Q2 not scheduled in window

Largest company in the world and still the largest mover in the Mag7 on a broad-tape day. Its +2.27% and SOXX's +2.02% are the two marks that override the stale ^SOX index print. Carries the AI capex trade and, if the reported \$250bn OpenAI backstop is real, some of OpenAI's balance-sheet risk too.

TSLA · TESLA INC

\$328.58 ▲ +9.05 +2.83%

Cap \$1.30tn (+25.8% y/y) · Close 7 Aug 16:00 ET · Next key date: none in the coming week

Best of the seven and the single largest contributor to XLY's sector-leading +1.49%. Highest duration sensitivity in the group, which is exactly what a six-basis-point two-year rally rewards. Smallest capitalisation of the Mag7 and the one whose move Friday was most purely a rates trade.

GOOGL · ALPHABET INC

\$354.30 ▼ -3.45 -0.96%

Cap \$4.33tn (+82.7% y/y) · After hours \$354.75 · Close 7 Aug 16:00 ET · Next key date: none scheduled this week

Only Mag7 decliner, on the day it also sat inside the second-weakest sector. The 82.7% twelve-month capitalisation gain is the largest re-rating in the group — and its investment gains are one half of the distortion inflating the index-wide +29.2% earnings surprise to something it is not.

MSFT · MICROSOFT CORP

\$499.99 ▲ +0.13 +0.03%

Cap \$3.71tn (-4.9% y/y) · Close 7 Aug 16:00 ET · Next key date: none scheduled this week

Closed one cent below \$500 on a session the Nasdaq gained 1.30%. The only Mag7 name whose capitalisation has *fallen* over twelve months. Analyst consensus is Strong Buy at a \$563.16 target; the tape has been disagreeing with that for a year.

CRWV · COREWEAVE INC

\$90.67 ▲ +5.34 +6.26%

Cap \$49.47bn · IPO 28 Mar 2025 · Close 7 Aug 16:00 ET · Next key date: Q2 results, Tue 11 Aug after US close

The purest listed proxy for AI infrastructure demand, and the week's first real test of it. Ran 6.26% into its own print, which raises the bar. The question the market will ask is not revenue growth — it is free-cash-flow conversion and whether the capex is fundable without dilution.

AMAT · APPLIED MATERIALS

\$539.14 ▲ +11.66 +2.21%

Cap \$428.06bn · Consensus Strong Buy, target \$629.06 · Close 7 Aug 16:00 ET · Next key date: Q3 FY26, Thu 13 Aug

The equipment layer, and the hardest number in the AI complex to fake — tools get ordered before chips get made. Rose 2.21% with the semis on Friday. Thursday's print lands the day after CPI, so it will be read through whatever rate regime Wednesday leaves behind.

TTD · THE TRADE DESK

\$13.80 ▼ -3.87 -21.90%

Cap \$6.48bn · 52w high \$91.45 (-84.9%) · TTM revenue \$2.99bn (+11.6%) · Net income \$406.89m · P/E 16.2 · Close 7 Aug 16:00 ET

Q2 missed on both lines with Q3 guidance well below consensus; downgrades followed. The single worst large-cap outcome of the session. A profitable, growing, cash-generative business has lost five-sixths of its market value in a year — and the sector it sits in, XLC, still closed green.

AAPL · APPLE INC

\$313.33 ▲ +0.92 +0.29%

Cap \$4.57tn (+44.5% y/y) · Close 7 Aug 16:00 ET · Next key date: none scheduled this week

Second-largest company in the world and a 0.29% day — it underperformed the S&P on a broad tech rally. The 44.5% twelve-month capitalisation gain has come without Apple leading any individual session in recent memory; it is being carried by multiple expansion rather than by momentum.

S Sources

PRICES AND INDICES. Yahoo Finance world-indices, commodities, bonds and currencies market pages, captured 06:15–06:28 GMT+8 — supplied the S&P, Nasdaq Composite, Dow, Russell 2000 and VIX closes; the ES/NQ/YM/RTY, WTI, Brent, natural gas, RBOB, gold, silver and copper futures settles (all stamped 16:59 ET); the CBOE yield indices; and EUR/USD, USD/JPY, USD/CNY and the wider FX board. The Yahoo ^GSPC security page, captured 06:30, supplied the day range, prior close, 52-week range and volume. Yahoo's crypto market page supplied the live Bitcoin and Ether marks at 06:26.

SECOND QUOTE SOURCE AND SINGLE STOCKS. StockAnalysis.com individual security pages, captured 06:22–06:38, supplied every Mag7 close, all eleven SPDR sector closes, SOXX, CoreWeave, Applied Materials and The Trade Desk — each page carrying an explicit "August 7, 2026, 4:00 PM EDT" stamp, which is why they were preferred over aggregated screens. The StockAnalysis multi-ETF comparison page was fetched, found inconsistent with the individual pages, and discarded.

TREASURIES. The US Department of the Treasury daily par yield curve, August 2026 table, captured 06:32 — the primary source, used in preference to every secondary yield quote encountered.

CURRENCIES, SECOND SOURCE. Trading Economics country currency pages, captured 06:29–06:31, supplied the live DXY (dated 10 August) and the Friday USD/KRW and USD/TWD closes with explicit dates. Trading Economics country stock-market pages, captured 06:36, supplied dated Friday closes for the Nikkei, Hang Seng, KOSPI and TAIEX and resolved a vendor conflict on all four.

SESSION NARRATIVE AND CORPORATE NEWS. STLNews and Investrade daily market reviews for 7 August; TheStreet's 7 August live blog; the Regal Discount Securities morning preview for 7 August, which supplied most of the single-stock corporate detail in §9. Where these disagreed on index levels or percentages, the exchange-stamped quote pages won.

MACRO AND POLICY. FactSet Earnings Insight, "S&P 500 Earnings Season Update: August 7, 2026," for every earnings-season statistic in \$2.4 and \$10. Yahoo Finance policy coverage for the Barkin, Cook, Ryan and Zentner attributions. Reuters via Investing.com for the September-hike probability flip. TradingKey's week-ahead preview for the CPI and PPI consensus figures and the earnings schedule; Capital Street FX's week-ahead was fetched but returned only navigation content.

GEOPOLITICS. Al Jazeera, 8 August 2026, "Iran deliberates Hormuz arrangement amid uncertain prospects with US," for the routing agreement, Araghchi's remarks, the IRGC position and Iran's list of demands. CNN's 8 August live file was blocked by robots and could not be read. The English Wikipedia article on the 2026 Strait of Hormuz crisis supplied the timeline, the \$126 Brent peak and the shipping-casualty figures, and is flagged in-line as tertiary.

AI. CNBC, Reuters and Al Jazeera coverage of the reported Nvidia–OpenAI financing talks, all tracing to the same Wall Street Journal report of 27 July; independent research-house estimates for 2026 hyperscaler capex. The CNBC article page itself returned a 403 and was read only through search summaries.

HEDGEYE. app.hedgeye.com insight pages 179835 and 179986, both fetched and both paywalled, supplying publication dates of 24 and 27 March 2026 and headline text only. The authenticated feed at app.hedgeye.com/feed_items/all was not reachable.

D Data-confidence

CROSS-CHECKS PASSED

- **S&P 500 arithmetic is self-consistent.** Prior close 7,709.96 + change 47.68 = 7,757.64 ✓. Close sits inside the day range 7,719.19–7,763.08 ✓, and inside the 52-week range 6,316.91–7,793.68 ✓. Position in day range = $(7,757.64 - 7,719.19) \div (7,763.08 - 7,719.19) = 38.45 \div 43.89 = 87.6\%$.
- **Every index future reconciles to its cash index at a sane basis.** ES 7,779.75 – S&P 7,757.64 = **+22.11** (+0.29%). YM 54,152.00 – Dow 54,036.93 = **+115.07** (+0.21%). RTY 3,041.60 – Russell 3,034.49 = **+7.11** (+0.23%). Three contracts, three positive carry bases between 0.21% and 0.29% — internally consistent and consistent with a September expiry at these rates.
- **Futures and cash agree on direction and magnitude.** ES +0.58% vs S&P +0.62% (4bp apart); YM +0.26% vs Dow +0.28% (2bp); RTY +1.08% vs Russell +1.10% (2bp). NQ +1.18% vs Composite +1.30% is a 12bp gap, explained by the Nasdaq 100 being a different basket from the Composite, not by a data error.
- **Treasury yields cross-checked against the issuer.** Yahoo's CBOE indices gave ^TNX 4.660, ^TYX 5.21, ^FVX 4.362, ^IRX 3.710. The Treasury Department's official par curve for 7 August gave 4.65 / 5.19 / 4.35 / 3.87. Agreement to within 1–3bp at every tenor except the 3-month, where the CBOE 13-week index and the Treasury 3-month constant maturity are different constructions. **Treasury's figures are used throughout.**
- **Semiconductor direction confirmed by two independent instruments.** SOXX ETF +2.02% and NVDA +2.27%, both stamped 16:00 ET, both from a source independent of the one that produced the contradictory ^SOX print.
- **Sector closes verified individually rather than in aggregate.** All eleven SPDR marks were pulled from separate security pages, each carrying a 16:00 ET 7 August stamp. Their dispersion (+1.49% to –1.13%) is consistent with a +0.62% cap-weighted index given XLK's and XLY's weights.
- **Asian closes double-sourced.** Nikkei 65,606.71/–0.12% and Hang Seng 25,668.03/+0.54% were returned identically by Yahoo's world-indices page and by Trading Economics' dated country pages.
- **Mag7 capitalisations sum sensibly.** 4.57 + 3.71 + 5.42 + 4.33 + 2.96 + 1.51 + 1.30 = **\$23.80tn**.

KNOWN CONFLICTS AND WEAK MARKS

- **Philadelphia SOX — unresolved, and printed as unverified.** The only ^SOX quote obtainable read 12,060.41, –0.98%, timestamped **10:34:56 ET** — mid-session. SOXX closed +2.02% and NVDA +2.27%, both at 16:00 ET. The brief prints the stale figure marked amber, states the direction is almost certainly wrong, and directs the reader to SOXX. **Do not use the SOX row.**
- **USD/CNH — two irreconcilable marks, neither printed as fact.** One source gave USD/CNH **7.2386** (open 7.2386, prior close 7.239, no timestamp); another gave onshore USD/CNY **6.7482, +0.08%**. Offshore and onshore renminbi do not trade 7% apart — one of these is from a different period. The brief prints CNY 6.7482 as the mark it stands behind and prints CNH as unresolved. Uncertainty: potentially the entire 7% gap.
- **Treasury yield changes — a secondary source is badly wrong and was rejected.** One market review stated the 10-year "fell 13 basis points to 4.657%" and the 2-year "dropped 40 basis points to 4.203%." The Treasury Department's own curve shows –4bp on the 10-year (4.69–4.65) and –6bp

on the 2-year (4.25–4.19). A 40bp single-day move in the 2-year would be a generational event; it did not happen. **Treasury's figures used; the secondary source is discarded for rates and treated with caution elsewhere.**

- **Index percentages in one live blog do not match the close.** TheStreet's page reported Nasdaq +0.86%, S&P +0.33%, Dow +0.09% — an intraday snapshot, not the settle. The settled figures (+1.30% / +0.62% / +0.28%) are used. That page's single-stock detail is still relied upon, but its index figures are not.
- **The Trade Desk's move is disputed by 3.8 percentage points.** One source said –18.1%; the exchange-stamped quote page said **–21.90% to \$13.80**. The stamped page is used. The direction and severity are not in question.
- **Weekly index performance is disputed and is therefore described qualitatively, not numerically.** One source: S&P +3.37%, Nasdaq +4.86%, Dow +2.10%. Another: S&P +3.6%, Nasdaq +5.2%, Dow +3.0%. The Dow figures differ by 90bp. The brief says "best five-day run since April" — on which both agree — and prints no weekly number.
- **Payroll consensus is quoted as +80,000 by two sources and +83,000 by a third.** The brief uses +80,000 and states the miss as "over 100,000," which is true under either. Prior-period revisions are given as –103,000 by one source and "over 100,000" by another; –103,000 is used.
- **Spot-versus-futures basis on the metals is a real difference, not an error, but it is a thin mark.** Gold: Dec future \$4,399.70 (+2.33%) against spot \$4,375.80 (+1.77%) — a \$23.90 contango and a 56bp difference in the daily change. Silver: Sep future \$63.50 (+3.07%) against spot \$64.69 (+5.01%) — spot \$1.19 above the future. The backwardation conclusion in \$2.6 and \$3 rests on two figures from **different vendors** and should be treated as indicative of direction rather than as a precisely measured basis.
- **September hike probability is quoted three ways.** "Flipped from likelier-than-not to worse-than-even" (Reuters), "below 57%" (Investrade), "near 50-50" (TradingKey). All three agree on direction and roughly on level; no single number is printed as authoritative.
- **Two narrative claims contradict the price data and are corrected in the brief.** One source wrote "Energy declined as oil dipped" — oil did not dip, WTI rose 1.15% while XLE fell 1.13%; the divergence is treated as the story. Another wrote that defensive sectors underperformed — XLV (+0.75%) and XLU (+0.53%) both beat XLI, XLC and XLP.
- **Aggregated screens were caught being stale twice.** A multi-ETF comparison page returned all eleven sectors negative except energy — the exact inverse of the verified closes. A second load of the world-indices page returned Nikkei 64,931.19 and Hang Seng 25,207.18, an earlier session than the first load. Both were discarded. This is why individual, timestamped pages were used for everything that mattered.
- **Market capitalisations are vendor-computed and FX-translated where applicable.** The y/y capitalisation percentages (NVDA +23.9%, AAPL +44.5%, GOOGL +82.7%, MSFT –4.9%, TSLA +25.8%) conflate price change with share-count change and should be read as indicative to perhaps ±2 percentage points.
- **Two single-sourced items are flagged in-line and not relied upon:** "SpaceX gained 11% after an analyst upgrade," and a report that the US administration is weighing further military action against Iran. Neither was corroborated.
- **The Hormuz crisis timeline is tertiary-sourced.** The \$126 Brent peak, the 70% traffic decline, the 20,000 stranded mariners and the casualty figures come from an encyclopaedic article, not from wire copy. Directionally reliable; specific figures should not be quoted onward without checking.

KNOWN GAPS

- **The entire authenticated Hedgeye layer is missing.** Chrome browser tooling is not attached to scheduled cloud runs, so app.hedgeye.com/feed_items/all could not be opened. Not read: the Early Look and its Risk Range™ Signals table, the Macro Show summary, the MOMO Tracker, KM's Top 3 / From The Desk, Chart of the Day, Crypto Quant, Capital Allocation Pro, Signal Strength Stocks, Real-Time Alerts and any long-form guest piece. **No risk-range bands, TREND signals or Hedgeye price levels appear in this brief, and none were estimated or carried forward.** The Quad path in \$4 is our inference from public data, not Hedgeye's published call. **The absence of a Hedgeye position change in this document is not evidence that no position change occurred — it is evidence that we could not see the feed.** Tonight's Early Look, published around 19:25–21:00 GMT+8, is the correct source and will supersede everything in \$4.
- **No live Globex prints.** Futures reopened at 06:00 GMT+8 and no vendor consulted had refreshed off the Friday 16:59 ET settle by 06:40. Every ES/NQ/YM/RTY figure in this brief is a **Friday settle**. Overnight futures volumes were not available from any source and are omitted rather than guessed.
- **The primary market-data feed was unavailable.** The FMP quote service returned an access-denied error on the account's current plan, which forced the entire capture onto web sources and materially lengthened the window.
- **No positioning data of any kind.** No CBOE put/call ratio, no AAI or Investors Intelligence sentiment, no CFTC Commitments of Traders, no dealer gamma, no CTA exposure estimate, no ODTE share. Section 6 is built from price and volatility alone and is thinner than the format intends.
- **Calendar coverage is partial.** Fed speakers, Treasury auction sizes and non-US data releases for 10–14 August could not be retrieved — the detailed week-ahead page returned navigation content only. Earnings dates are from company-page calendars and are **secondary-source, unconfirmed against the exchange calendar**.
- **Blocked or failed sources.** CNN (robots), CNBC article pages and quote pages (403 on five of six attempts), Washington Post (403), Investing.com article (403), Yahoo multi-quote comparison views (robots). Where a blocked page was the best source, the item is either sourced elsewhere and marked, or omitted.
- **No image-based content was extractable.** The Hedgeye Chart of the Day images were present but their content is not machine-readable and no text was recovered from them.
- **Markets not open.** No Asian cash tape exists at the time of writing — \$12 is a setup, not a report. Friday's Asian closes predate the US payroll print entirely.
- **Friday after-hours (16:05–18:00 ET) is effectively empty.** No material earnings were identified in that window; Alphabet's \$354.75 after-hours mark is the only post-close print captured. This is normal for a Friday and is not a coverage failure, but it has not been positively confirmed against a full after-hours calendar.

TIMING & UNVERIFIED

- **Capture window: 06:15–06:40 GMT+8, Monday 10 August 2026** — a 25-minute spread, wider than the 10-minute target because the primary data feed failed and the capture had to be rebuilt across multiple web sources. No table mixes marks from opposite ends of that window without saying so.

- **What is a Friday mark:** all US cash equity closes, all eleven sector ETFs, all Mag7 and single-stock closes, all Treasury yields, all commodity settles, all index futures, USD/KRW, USD/TWD and all Asian index closes. These are 40+ hours old at the time of reading and will not change.
- **What is live at capture:** DXY 99.638, Bitcoin \$64,971.76, Ether \$1,913.14, and the FX board (EUR/USD, USD/JPY and the crosses) to the extent those pages refresh continuously.
- **What has already moved since capture:** Globex has been trading since 06:00 GMT+8 and by the time this is read the index futures will have real levels that this brief does not contain. FX and crypto move continuously. **Assume every futures number here is superseded.**
- **What will be superseded today:** tonight's Hedgeye Early Look (≈19:25–21:00 GMT+8) supersedes the whole of \$4 — its Risk Range™ table is the authoritative set of bands and nothing in this brief substitutes for it. Asian cash opens from 08:00 supersede \$12. Wednesday's CPI supersedes the rate path in \$2 and \$3.
- **Instruction: verify every live price before acting on it.** Nothing in this document is a recommendation, and several marks in it are explicitly flagged as unverified, disputed or stale. The Philadelphia SOX row and the USD/CNH row should not be used at all. Check the tape.
