

Daily Need to Know

Thursday, 10 September 2026 · Pre-market brief

Coverage window, capture method and edition notes are at the back, in section 16.

1 Market snapshot — the close, and where it is trading now

ASSET	LAST	CHANGE	NOTE
US CASH EQUITIES — SETTLED 16:00 ET WED 9 SEP (04:00 HKT), ~2H OLD			
S&P 500	7,636.36	▼ 37.16 · -0.48%	Third straight decline. Opened at the high of 7,660.68 and never traded above it; closed at 33% of a narrow 0.48% range. AP wire confirms the close and the point change exactly.
Nasdaq Composite	26,253.34	▼ 168.07 · -0.64%	Held up better than the Dow only because Meta and the semis carried it. Comm Services and Tech were the two best S&P sectors.
Dow Jones	52,380.66	▼ 405.41 · -0.77%	Worst of the majors. Opened at the high, closed at 17% of range. Week-to-date -1,033.59 points, -1.9%.
Russell 2000	2,921.23	▼ 38.97 · -1.32%	Closed at 5.7% of its daily range — effectively on the low. 4.8% below its 52-week high and 9 points off Hedgeye's band floor.
Philadelphia SOX	11,931.31	▲ 43.44 · +0.37%	The only major index up. Traded to 12,016 intraday. Memory led — Micron, SanDisk, Western Digital all higher. Still 18.6% under its 52-week high.
INDEX FUTURES — SETTLED 17:00 ET (05:00 HKT); LIVE GLOBEX PRINT AT 06:16 HKT SHOWN IN THE NOTE			
ES (E-mini S&P)	7,643.75	▼ 36.75 · -0.48%	Basis to cash +7.39 (+0.10%), normal. Live 06:16 HKT: 7,646.50, +0.04% on 1,429 lots — 16 minutes of trade, no information in it yet.
NQ (E-mini Nasdaq)	29,448.75	▼ 90.00 · -0.31%	Shallowest futures decline of the four. Live 06:16: 29,433.00, -0.05%.
YM (E-mini Dow)	52,425	▼ 407 · -0.77%	Basis +44 to cash. Live 06:16: 52,469, +0.08%.
RTY (E-mini Russell)	2,923.0	▼ 40.60 · -1.37%	Traded 2,919.4 low, matching the cash index. Live 06:16: 2,922.10, -0.03%.
US TREASURY YIELDS — CASH MARKET, CAPTURED 06:07 HKT; SETTLE MARKS DIFFER, SEE FOOTNOTE			
US 10-year	4.845%	▲ 5.3bp	Intraday high 4.857% is a fresh 52-week high and the highest since November 2023. Sits at 91.7% of Hedgeye's 4.68-4.86 band — a point and a half of basis from the ceiling.
US 30-year	5.293%	▲ 4.4bp	52-week high is 5.337%. The long end rose less than the belly — this was not a term-premium move, it was an inflation move.
US 5-year	4.620%	▲ 5.4bp	Largest rise on the curve and within 0.3bp of its own 52-week high of 4.623%. The belly is where the repricing is.
US 2-year	4.436%	▲ 3.6bp	Closed exactly at its 52-week high. 71% of the 4.28-4.50% range Hedgeye put out on the Macro Show. This is a rate-hike price, not a rate-cut price.
13-week bill	3.900%	▲ 2.8bp	The bill moved least. 2s vs bills at +53.6bp — the front end is pricing the September FOMC, not the funds rate as it stands.
ENERGY — WTI AND BRENT ARE SETTLES; LIVE OVERNIGHT PRINTS IN THE NOTE AND SECTION 12			
WTI crude (CL1!)	\$96.05	▲ 3.02 · +3.25%	Newsquawk settle wrap confirms \$3.02 higher at 96.05. Live 06:16 HKT: \$97.57, a further +1.58% — and above Hedgeye's \$97.53 ceiling.
Brent crude (BZ1!)	\$101.21	▲ 3.29 · +3.36%	First close above \$100 since July. Newsquawk settle confirmed. Live 06:16: \$102.46, +1.24%. Six-session advance intact.
Natural gas (NG1!)	\$2.822	▼ 0.094 · -3.22%	Fell hard while crude ripped. At 9.6% of its band — near the floor while WTI is near the ceiling. Live 06:16: \$2.803.

RBOB gasoline	\$3.2106	▼ 0.042 · -1.29%	Down 1.3% on a day crude rose 3.3%. That spread is anomalous and probably a contract-roll artefact — treat as a weak mark.
METALS — SPOT, THE SERIES HEDGEYE'S RISK RANGES NAME. BARS ROLLED 17:00 ET; CHANGES COVER ~76 MIN			
Gold (spot)	\$4,403.30	◆ +0.08%	Change is noise over a 76-minute bar. The level matters: 36.7% of the 4,290–4,599 band, and above the 4,381 line McCullough said would flip it bullish trade and trend . Dec futures settled 4,460.70, +0.49%.
Silver (spot)	\$67.296	◆ +0.03%	82.4% of a 64–68 band Hedgeye rates neutral. Futures were the real move: SI1! settled 68.646, +2.46%. Spot-futures basis 2.01%.
Copper (spot)	\$6.7345	◆ +0.10%	94.0% of its 6.49–6.75 band — a penny and a half from the ceiling. HG1! futures printed 6.894, a fresh 52-week high. Measured on futures this row would read a false 152%.
FX AND VOLATILITY — SPOT, CAPTURED 06:07 HKT; FX BARS ROLLED 05:00 HKT SO CHANGES COVER ~67 MIN			
Dollar index (DXY)	98.782	◆ -0.06%	McCullough flagged 98.77 as a fresh three-month low in the Early Look. Bearish TREND signal, 33.5% of band. Hedgeye's whole long-commodity book hangs off this row.
USD/JPY	153.508	◆ -0.03%	Yen the G10 outperformer, with Treasury Secretary Bessent publicly daring traders to fight him on it. Session low 152.39 during US hours.
USD/KRW	1,340.01	◆ -0.07%	Won range 1,334.11–1,342.06 spans the prior Korean session. KOSPI closed +1.40% — Korea is the one Asian market with momentum.
VIX	16.47	▲ 0.76 · +4.84%	Closed above Hedgeye's 16.34 ceiling, at 105% of a band still signalled bearish. Intraday high 16.68. McCullough called it "investable" at 15.72 at 22:49 HKT — it broke out after he spoke.
CRYPTO — GENUINELY 24-HOUR AND THE ONLY CONTINUOUSLY LIVE ROW IN THIS TABLE			
Bitcoin	\$78,007	▼ 438 · -0.56%	Still falling at capture: 06:16 print \$77,854, a new session low of \$77,773.62 . 38.2% below its 52-week high. McCullough put upside at 81–82k on the weak dollar; it is going the other way.

Colour key: ▲ green up · ▼ red down · ◆ amber directionally immaterial or measured over a partial bar. Treasury yield rows are the one deliberate exception: they are coloured by market impact, so a rising yield carries the ▲ glyph in red. Reconciliation: all four cash index closes and point changes match the Associated Press "How major US stock indexes fared" wire to the decimal. WTI and Brent settles match Newsquawk's settle wrap exactly. Treasury yields are the one row where sources differ: Newsquawk's settle marks are 10y 4.833% and 2y 4.425% against our 06:07 HKT marks of 4.845% and 4.436% — a 1.2bp and 1.1bp gap consistent with a cash close versus a later print. Both are given in section 18.

TL;DR

Brent closed above \$100 for the first time since July because the United States and Iran are shooting at each other's shipping in the Strait of Hormuz, and the equity market took the third straight down day as the bill. That is the whole session: an oil shock and a rates shock arriving together, with no US data on the calendar to argue with.

The front end is the part that should worry people. The 2-year closed **exactly at a 52-week high of 4.436%** and the 10-year printed **4.857% intraday, its highest since November 2023** — and it did that on a day the Treasury announced it was *tripling* long-bond buybacks to \$6bn. The buyback was meant to hold yields down. Yields rose 5bp anyway. Futures now price roughly a **62% chance the Fed hikes** on 16 September, and August CPI lands Friday at 20:30 HKT with oil at \$100.

Underneath, breadth was worse than the tape: 78% of the S&P closed red, the equal-weight index fell about 1%, and the Russell finished on its low. Energy was the only sector up and printed a fresh 52-week high. The offsetting bid was narrow and specific — **Meta +6.55%** on the Muse agent launch, and memory semis. Hedgeye flipped the S&P to **bearish TRADE** below 7,695, covered its Korea, DRAM and semiconductor shorts, and sold its high-yield credit long. Overnight, crude has added another 1.6% to \$97.57.

2 The big picture — what it means

1. This was a supply shock priced through the oil complex, not a growth scare priced through equities. The S&P fell 0.48% — trivial. Brent rose 3.36% to \$101.21 and WTI 3.25% to \$96.05, and both have extended overnight. The distinction matters because the two have opposite policy consequences. A growth scare gives the Federal

Reserve room to ease. A supply shock two days before a CPI print does the reverse, which is precisely why the 2-year yield closed at a 52-week high on a day equities fell.

2. The Treasury tried to cap yields and failed in public. Treasury announced it would buy back a maximum of \$6bn in 10-20 year coupons, up from prior guidance of at least \$4bn — the third escalation of the programme. Yields rose about 5 basis points on the announcement, with the 10-year pushing above 4.85% for the first time since November 2023. When an authority intervenes explicitly and the price moves against it, the information content is the failure, not the intervention. McCullough built the entire Early Look around this: "you cannot manipulate one part without the whole responding."

3. And yet the auction was excellent, which complicates the bearish read. The 10-year auction at 13:00 ET drew a bid-to-cover of **2.71x**, up 0.18 from 2.53x, with indirect bidders taking 79.2% and primary dealers left with just 4.3%. That is not a failed auction; it is genuine demand arriving once the concession was big enough. The honest reading is that the market will fund the United States — at 4.83%, not at 4.68%. Price, not access, is the constraint.

4. Breadth has stopped broadening and nobody should let the index level disguise it. Around 78% of the S&P closed lower and the equal-weight index fell roughly 1% against the cap-weighted 0.48%. Hedgeye's own Macro Show put it at 71% of US stocks down an average of 2.1% the previous day, with the summary calling breadth "dog breath" and noting the firm has exited its equal-weight and broadening exposures entirely. A 0.48% index decline built on 78% decliners and one 6.6% mega-cap gain is a narrower market, not a resilient one.

5. Meta's move is a genuine business event, and Alphabet's fall is the other side of the same trade. Meta launched Muse, an autonomous personal agent that books, buys, emails and schedules across Google Workspace, OpenTable, Ticketmaster, Spotify and Apple Health — and, critically, launched it with **\$20 and \$100 monthly tiers**. That is the first direct monetisation of Meta's AI capital spending, against a base of more than 3.6 billion monthly users. Meta rose 6.55% on roughly twice normal volume; Alphabet fell 2.28%, the worst of the Mag7, with Morgan Stanley calling Muse a "new potential threat to the position of search". Roughly \$102bn of Meta market value was created and \$95bn of Alphabet's destroyed on the same headline.

6. Hedgeye has changed its mind on the short side, and that is more informative than any of its longs. Having gone net short US equities on 4 September, the firm covered its South Korea short, its DRAM short and its semiconductor short on Wednesday, exited equal-weight S&P, and told subscribers to buy the three worst mega-caps of the prior session — Nvidia, Apple and Microsoft. It simultaneously **sold its high-yield credit long (HYG)** and its high-dividend long. Covering equity shorts while selling credit is not a bullish reversal; it is a rotation out of duration-sensitive carry and into things that go up when the dollar goes down.

7. The dollar is doing the work, and Washington is now openly part of the story. DXY sits at 98.78, a three-month low, with the yen the strongest G10 currency after Treasury Secretary Bessent publicly dared traders to bet against his support for it — reported by Bloomberg under the line "I am the house now". A weaker dollar mechanically raises the domestic price of oil, copper and gold, which raises measured inflation, which raises the front end, which is exactly the sequence the curve printed on Wednesday. Copper spot closed at 94% of its band and the CRB commodity index made a fresh cycle high.

3 Rates, currencies & commodities

- **The belly led the sell-off.** The 5-year rose 5.4bp to 4.620% and the 10-year 5.3bp to 4.845%, against 4.4bp on the 30-year and 2.8bp on the 3-month bill. A curve that steepens through the middle rather than the long end is repricing the policy path, not the term premium.
- **2s10s sits at +40.9bp** on our marks (4.845% less 4.436%), essentially unchanged on the day since both moved together. The front end is not leading the long end lower — the whole inflation-sensitive part of the curve moved as a block.
- **Bond volatility stayed calm through all of it.** The MOVE index closed 76.74, up just 0.6 points, against a 52-week range of 55.77 to 115.02. Yields at three-year highs with rate volatility in the bottom third of its range describes a market that believes the direction, not one that is panicking about it.
- **Mortgage rates are already transmitting.** The 30-year fixed contract rate rose 6bp to **6.85%**, the highest since June 2025, and applications fell 2.7% with refinancings down 6.2% (MBA, week ended 4 September). Goldman's US housing factor basket was the worst performer of the previous session at -3.0%, a 10.1% one-month drawdown.
- **Dollar weakness is broad, not just yen.** EUR/USD 1.1636, GBP/USD 1.3549, USD/CNH 6.7053 — the offshore yuan is within 0.03% of its 52-week strong end at 6.70286. A dollar falling against both the funding currency and the Chinese currency at once is a dollar problem, not a carry-trade rotation.
- **The commodity complex is not uniform, and the split is informative.** Crude and copper are pinned near their band ceilings; natural gas is at 9.6% of its band and wheat fell 2.44% to 728.75 with corn off 1.08%. What is rising is what the war and the dollar touch. What is falling is what a slowing global economy touches. That is a Quad 3 signature — growth down, inflation up — and it is exactly what Hedgeye has the rest of the world in.
- **Gold reclaimed its line.** Spot closed 4,403.30, above the 4,381 level McCullough named on air as the trigger to go bullish TRADE and TREND and "buy more". December futures settled 4,460.70, +0.49%. Overnight the futures have given back 0.26%.

4 Hedgeye — regime, risk ranges & the Quad path

Macro dashboard

ITEM	READING	NOTE
US monthly Quad	Quad 2 — growth up, inflation up	Referenced in writing in Wednesday's Early Look ("CRB ramped to new #Quad2 Cycle Highs"). This is the first written confirmation; the shift had previously only been asserted verbally on the 8 September Macro Show.
US quarterly Quad	Quad 4 — growth down, inflation down	Carried forward from the 4 September dashboard. Six days old and not republished.
Global Quad	Quad 3 — growth down, inflation up	Consistent with the commodity/agricultural split above.
Forward Quad path	Not printed — unknown	The path notation lives in the US Monthly Quad Forecast inside the Macro Week Summary Notes, which is still dated 4 September and reachable only as a gated PDF. Fourth consecutive edition unable to read it. No path is asserted here.
S&P 500 signal	Bearish TRADE / bullish TREND	TRADE line 7,695, TREND line 7,501. SPX closed 7,636.36 — below TRADE, above TREND. This is a signal change on the day.
Inflation nowcast	Not readable	The Hedgeye Monthly Inflation Nowcast published 9 September 00:20 HKT returned an explicit access-denied page — a subscription-tier boundary, not a fault.

Risk Range™ Signals — Early Look, 9 September 19:42 HKT

INSTRUMENT	RANGE	TREND	WHERE IT STANDS, AND HOW THE BAND ITSELF MOVED
UST 10-year yield	4.68–4.86	bullish	4.845% — 91.7% of band. Band shifted down 2bp/1bp while the yield rose. Intraday 4.857% came within 0.3bp of the ceiling.
High Yield (HYG)	78.91–79.49	bullish	78.98 — 12.1%, near the floor. Hedgeye sold this long on Wednesday even though the signal still reads bullish. Band ticked up 1–2 cents against a falling price.
Inv. Grade (LQD)	104.6–106.1	bearish	105.31 — 47.3%, mid-band. Floor cut 10 cents. Hedgeye remains short.
S&P 500	7,604–7,767	bullish	7,636.36 — 19.9%. Whole band moved <i>down</i> : floor –11, ceiling –5. A band tracking price lower while the TRADE signal flips bearish is the weakest configuration in the table.
NASDAQ Composite	26,008–26,711	bullish	26,253.34 — 34.9%. Band narrowed 89 points , floor up 91, ceiling up 2. Compression usually precedes a directional resolution.
Russell 2000	2,912–3,014	neutral	2,921.23 — 9.0%, the lowest position in the table. Band unchanged at both ends for a second session. Intraday low 2,918.89 was 6.8% of band.
Health Care (XLV)	166–175	bullish	166.58 — 6.4%. Hedgeye cut the floor from 168 to 166 after price broke below it — the band chased the price down rather than the long being cut. Still a stated long.
Tech Software (IGV)	99–112	bullish	Band unchanged. No position reported — IGV is absent from the capture universe for a fifth consecutive edition.
Oil Services (OIH)	414–444	bullish	Floor raised 2 points, ceiling unchanged. No position reported — also absent from the capture universe. Hedgeye remains long.
Volatility (VIX)	13.85–16.34	bearish	16.47 — 105.2%, above the ceiling. The single most important row: a bearish-signalled instrument trading through its own band. Both ends were raised (+0.07/+0.03) and price still cleared it.
US Dollar Index	98.41–99.52	bearish	98.782 — 33.5%. Band cut hard at both ends , floor –0.19 and ceiling –0.15 — the largest downward shift of any row, confirming the bearish trend rather than fading it.
WTI crude (continuous)	86.36–97.53	bullish	96.05 — 86.8% at the settle. Band widened 30 cents and chased price up (floor +0.61, ceiling +0.91) for a second session. The 06:16 HKT print of \$97.57 is already through the ceiling.
Natural gas (continuous)	2.80–3.03	bullish	2.822 — 9.6%, near the floor and falling. Floor cut 4 cents. The one energy row going the wrong way for a bullish signal.
Gold spot	4,290–4,599	bullish	

			4,403.30 — 36.7%. Band narrowed 63 points (floor +16, ceiling -47), the largest compression in the table. Measured on futures this row would read a misleading 55%.
Copper spot	6.49-6.75	bullish	6.7345 — 94.0% . Floor cut 2 cents, ceiling unchanged. On HG1! futures this would print an impossible 152% — the spot-futures basis is 2.29%.
Silver spot	64-68	neutral	67.296 — 82.4%. Floor raised a dollar, band narrowed to 4.00. Hedgeye sold its entire silver position on 8 September and has not returned.

Bands are from the Early Look of 9 September, published 07:42 ET / 19:42 HKT, authored by Keith McCullough. Band moves are measured against the 8 September Early Look, recorded in the archive state file at the end of the previous run — the category feed does not paginate, so this diff is only possible because the prior set was stored. Positions are measured on the series Hedgeye names: spot for gold, silver and copper; the continuous contract for crude and natural gas. Wednesday evening's Early Look supersedes these ranges at approximately 19:30 HKT tonight.

What Keith actually said

From the Early Look, "Burning Down The USD House?", 9 September 19:42 HKT:

- "US Dollar Index down at fresh 3-month lows of \$98.77 and signaling lower-lows within its Bearish TREND"
- "UST 2yr Yield continues to signal new Inflation Cycle Highs with the TRR up at 4.50%" and "UST 10yr Yield continues to signal new Inflation Cycle Highs with the TRR up at 4.86%"
- "Up Yen = Down Dollar / Down Dollar = Inflation Accelerating / Moarrr War = Inflation Accelerating more / Moarrr Inflation Accelerating = more new highs for Bond Yields"
- On the Treasury Secretary: "Scott Bessent apparently missed that chapter of Bohm's book. 'I am the house now.' His words, not mine, about Yen intervention and market manipulation."
- "This is a closed market system. The Implicate Order doesn't leak. The devalued money has to flow somewhere."
- "Did you know Rubber prices have inflated +14% in the last month?"

From **The Macro Show** summary notes of 9 September, published 22:49 HKT. These notes carry Hedgeye's own disclosure that they have been "enhanced by AI and may contain errors", so they are reported here as attributed summary rather than as quotation: McCullough said the S&P's TRADE line is **7,695** and TREND **7,501**, making it bearish trade and bullish trend, and that below TRADE the process is to stop buying and reduce toward minimum position sizes until the level is reclaimed. He put the updated **2-year risk range at 4.28-4.50%** and said a hawkish CPI could push the 2-year toward 4.50%. He said oil had immediate-term upside toward **97.53**. He described breadth as "dog breath". He said the signal took Hedgeye **out of the South Korea short, the DRAM short and the semiconductor short**, and that he would buy the three worst-performing mega-caps of the prior session — Nvidia, Apple and Microsoft. He put **gold's key line at 4,381** and Bitcoin's upside at roughly **81,000-82,000**. He called the VIX "investable" at **15.72** — it subsequently closed at 16.47, above the published band ceiling.

Position changes published on 9 September

ETF Pro Plus, 22:28 HKT. **Adding long:** Singapore (EWS), Corn (CORN). **Removing long:** High Dividend (HDV), **High Yield Bonds (HYG).** **Removing short:** AMD Option Income Strategy (AMDY). **Signal Strength Stocks, 10 Sep 00:00 HKT:** the list fell from 62 names to **61**. Added PFE, U, CAH, FSK, VREOF, SNDL; removed SPGI, SBUX, COF, SHOP, EVER, BRCB. The additions are defensive and income-oriented; the removals are financials and consumer.

5 Mag7 scoreboard

NAME	LAST	DAY	CAP	READ
Meta (META)	653.69	▲ +6.55%	\$1.67tn	The day's only real equity story. Muse agent launch with \$20/\$100 monthly tiers — the first direct monetisation of Meta's AI spend. 35.4m shares against a 19.8m ten-day average; closed at 78% of its range. Gave back 0.55% after hours.
Apple (AAPL)	315.34	▼ -0.28%	\$4.60tn	Sold off through its own "Surprise and Shine" event — foldable iPhone Duo at \$1,999, iPhone 18 Pro, A20 Pro chip. 9.3-point intraday range on 65.2m shares vs 41.1m average. Recovered +0.62% after hours. Hedgeye still calls it bullish trade and trend.
Microsoft (MSFT)	491.65	▼ -0.47%	\$3.65tn	Quiet. Volume 12.9m against a 21.6m average — a 40% shortfall, which is not distribution. Named on the Macro Show as the first thing McCullough would buy.
Nvidia (NVDA)	223.67	▼ -0.91%	\$5.39tn	Fell while the SOX rose — the semiconductor bid was in memory, not accelerators. Volume 79.3m vs 153.8m average, roughly half. Still the largest company on the board.
Alphabet (GOOGL)	330.65	▼ -2.28%	\$4.03tn	Worst of the seven, and directly the other side of Meta. Mizuho and Morgan Stanley both framed Muse as a threat to search. Compounded by EU-mandated search-results changes. Offset: a €13bn Finnish AI infrastructure commitment.

Amazon (AMZN)	252.40	▼ -1.78%	\$2.72tn	Second-worst of the seven on exactly average volume. Agent-commerce disintermediation is the obvious read-across from Muse's Shopify and OpenTable integrations, though no analyst named Amazon directly.
Tesla (TSLA)	367.81	◆ -0.10%	\$1.45tn	Effectively unchanged after a 9.4-point range, on 32.5m shares against a 43.6m average. Moved back to bullish trade on Hedgeye's signal, which McCullough attributed to index flow rather than anything Tesla-specific.

Market capitalisations are TradingView's market_cap_basic field captured 06:07 HKT, single-sourced. Aggregate Mag7 capitalisation on these marks is roughly \$23.5tn; the group added about \$7bn net on the day, entirely because Meta's roughly \$102bn gain offset Alphabet's roughly \$95bn loss.

6 Positioning & options

- **The VIX broke its band, which is the cleanest positioning signal available this morning.** 16.47 against a published 13.85–16.34 range still labelled bearish. Hedgeye's own framework treats a bearish-signalled instrument closing above its ceiling as an unresolved contradiction — either the signal turns or the price comes back.
- **Volume was not the story.** S&P cash volume 2.74bn against a 2.76bn ten-day average; SPY traded 32.7m against 36.5m. This was a repricing on ordinary participation, not a liquidation.
- **Two conspicuous volume outliers on the long-duration side.** TLT traded **40.6m shares against a 25.0m average** and LQD **34.1m against 24.9m** — 62% and 37% above normal, on a day both fell. Heavy volume in falling long bonds while equity volume was merely average says the marginal seller was in rates.
- **Tier1 Alpha flow data was described on the Macro Show as "neutral-ish"**, with McCullough citing a potential **\$7bn of mechanical buying** if the S&P reclaims 7,695 and one- and three-month realised volatility keeps rolling off. That level is 0.77% above Wednesday's close and is the number to watch today.
- **Friday 18 September is quadruple witching**, two days after the FOMC. The September expiry sits directly on top of the policy event, which tends to pin and then release.
- **Sentiment has cooled without capitulating.** The Fear & Greed reading was 42 (Fear) against 52 a week earlier, per Hammerstone. Fear at 42 with the index 2.3% off its high is caution, not positioning washout.

7 Sector rotation — leaders & laggards

SPDR SECTOR	LAST	DAY	NOTE
Energy (XLE)	65.31	▲ +0.83%	Only sector up, and it printed a fresh 52-week high of 65.915 intraday.
Technology (XLK)	187.87	◆ 0.00%	Exactly flat to the cent. Memory strength cancelled accelerator weakness.
Health Care (XLV)	166.58	▼ -0.33%	Best of the decliners despite UnitedHealth's 7.5% intraday range. Sits at 6.4% of Hedgeye's band.
Financials (XLF)	57.06	▼ -0.42%	Resilient given the yield move. Banks are not trading this as a credit event.
Communication Svcs (XLC)	110.83	▼ -0.62%	Would have been far worse without Meta; Alphabet's 2.28% fall is the larger index weight drag.
Materials (XLB)	51.39	▼ -1.06%	Fell despite copper at a 52-week high in futures — miners are trading the growth read, not the metal.
Real Estate (XLRE)	43.41	▼ -1.12%	Straight rates read. Mortgage rate at 6.85%, the highest since June 2025.
Consumer Staples (XLP)	83.05	▼ -1.15%	Staples fell more than Financials on a risk-off day. Defensives are not defending when the driver is the discount rate.
Utilities (XLU)	42.94	▼ -1.17%	Hedgeye's largest short. Volume 16.9m against a 21.9m average — falling on light trade.
Consumer Disc. (XLY)	112.46	▼ -1.34%	Volume 7.7m vs 5.4m average, 43% heavy. Tapestry -3.29% amid a broad luxury de-rate.
Industrials (XLI)	171.79	▼ -1.51%	Worst sector. Hedgeye added this short via ETF Pro on 8 September and it worked immediately.

SPDR ETF closes captured 06:07 HKT. Independent check: Newsquawk's sector table gives Industrials -1.51%, Utilities -1.17% and Real Estate -1.12% — matching to two decimal places on three of eleven sectors. Newsquawk shows Energy +1.09% against XLE's +0.83% and Tech -0.16% against XLK's 0.00%; that gap is ETF-versus-GICS-index construction, not a data error, and both are reported.

- **Leaders.** Energy alone, on the oil move, and it was not a crowded chase — XLE volume of 25.2m was slightly below its 26.6m average. A sector making 52-week highs on below-average volume is being held, not bought.
- **Laggards.** Industrials, Consumer Discretionary and Utilities — a cyclical, a consumer and a bond proxy. There is no single factor that explains all three except a higher discount rate applied to a slowing economy.
- **Rotation.** The dispersion between best and worst was 2.34 percentage points across a session in which the index moved 0.48%. That is a rotation day wearing a quiet day's clothes, and it is why the equal-weight index fell twice as much as the cap-weighted one.

8 Forward — futures & the week ahead

Sixteen minutes into the new Globex session at 06:16 HKT, US equity futures are doing nothing and the oil complex is doing everything. ES is 7,646.50, up 0.04% on 1,429 lots; NQ 29,433.00, down 0.05%; YM 52,469, up 0.08%; RTY 2,922.10, down 0.03%. Those are rounding errors on a few hundred to a few thousand contracts and carry no information. **WTI, by contrast, is \$97.57 — a further 1.58% above its own settle and already above the \$97.53 ceiling Hedgeye published twelve hours ago** — with Brent at \$102.46, up 1.24%. Precious metals are unwinding some of the day session: December gold -0.26%, silver futures -0.99%, copper futures -0.38%. Bitcoin is the only genuinely continuous market and it is making new lows at \$77,854, with Ether down 1.53% at \$2,446.72 and both printing session lows in the minutes before capture. The set-up Asia inherits is therefore an energy squeeze with an equity market that has not yet decided what to do about it.

DAY (GMT+8)	KEY EVENTS
Thursday 10 Sep — today	20:15 ECB rate decision — all 65 economists in the Reuters poll expect +25bp to a 2.50% deposit rate and then a stop; presser 20:45. 20:30 US August PPI and core PPI . 20:30 initial jobless claims (w/e 5 Sep). 22:00 existing home sales (August). 22:00 wholesale trade, July final. Fri 00:00 EIA Weekly Petroleum Status Report for w/e 4 Sep, delayed from Wednesday by the Labor Day holiday — the first inventory read since crude went to \$100.
Friday 11 Sep	~04:05 Oracle fiscal Q1 2027 after the US close, call 05:00. Adobe fiscal Q3 the same evening. 20:30 US August CPI and core CPI — the week's event. 22:00 University of Michigan sentiment, preliminary September. ~21:30 Kroger fiscal Q2 before the US open.
Tue 15 - Wed 16 Sep	FOMC . Decision Thu 17 Sep 02:00 HKT with the Summary of Economic Projections and dot plot. Fed blackout runs 5-17 September. Wed 16 Sep 20:30 US advance retail sales for August; 14:00 UK August CPI.
Thu 17 - Fri 18 Sep	Bank of England Thu 19:00, base rate 3.75% after a divided 6-3 hold on 30 July. Bank of Japan concludes Friday, statement around 11:00-12:00 HKT; swaps price roughly 75% odds of +25bp to 1.25%. Friday 18 September is quadruple witching.

Times converted from US Eastern at +12 hours (US daylight time). The US earnings slate for the week of 14-18 September could not be confirmed for 2026 — searches returned prior-year data — so no names are listed for that week. Oracle's date and time are confirmed against the company's own release.

9 Corporate news

- **Meta launched Muse.** An autonomous personal AI agent for US adults, announced late Tuesday, that sends email, schedules, buys online, books travel and restaurants and fills web forms — available on iOS, Android, web and inside WhatsApp, with integrations to Google Workspace, OpenTable, Ticketmaster, Spotify, Shopify and Apple Health. **The commercial point is the pricing: a free tier plus \$20 and \$100 per month.** Meta's chief AI officer posted that early usage had "blown way past our projections". Mizuho called it a possible major product cycle "not yet priced into shares". Stock +6.55%.
- **UnitedHealth had two events and a 7.5% intraday range.** Bloomberg reported Tuesday evening that UNH had sold an interest in part of its Florida WellMed senior primary-care clinics to TPG, terms undisclosed — the market could not price it, and the stock gapped down to \$378.08. CFO Wayne DeVeydt told Bloomberg "we didn't need the dollars... we needed the focus", and guided Optum Health margins to 2% this year and 4% next. Management then reaffirmed FY26 adjusted EPS of \$19.50-\$20.00 and \$24bn of operating cash flow at the Wells Fargo healthcare conference, and the stock recovered to close -1.94% at 393.06. Sector read-across was minimal.
- **Memory semiconductors were the bid.** Goldman Sachs told clients the worst of the memory downturn may be over, citing Micron and SanDisk breaking out of summer downtrends with hedge-fund positioning still light. MU +2.75% to 1,027.77, SNDK +1.51%, WDC +1.04%. The counterweight the same day: Kioxia's chief executive told Bloomberg he has instructed sales teams to stop pushing data-centre customers for higher prices — "prices have already risen enough" — after a 70% quarter-on-quarter rise in average NAND pricing.
- **AMD +3.04% to 521.10** on follow-through from CFO Jean Hu at the Citi TMT conference, who put the AI chip addressable market at **\$2-3 trillion by 2030** and said the data-centre business would more than double next year. In the same appearance she closed the door on Intel Foundry, reaffirming TSMC as AMD's primary wafer supplier — which makes Intel's +1.69% to 106.24 a weaker print than it looks.
- **Marvell +6.4%** after its chief executive raised the FY27 revenue target to roughly \$12bn from \$10bn and FY28 to roughly \$18bn from \$13.5bn. Astera Labs +6.1%. Analog Devices agreed to buy Alif Semiconductor for \$1.35bn cash.
- **Apple's product event landed flat.** The foldable iPhone Duo at \$1,999, available 23 October, plus iPhone 18 Pro and Pro Max, the A20 Pro chip, AirPods 5 and Watch S12/Ultra 4. The stock sold off through the presentation and closed -0.28%.
- **Tapestry -3.29%**, the worst notable single-stock decline outside healthcare. **No company-specific catalyst could be found.** The likely explanation is sector: HSBC cut LVMH and Burberry to Hold on 9 September citing limited second-half visibility in luxury. This is offered as inference, not as a reported cause.

- **After the close**, American Eagle reported fiscal Q2 EPS of **\$0.79 against a \$0.21 consensus** on revenue of \$1.38bn, and AeroVironment adjusted EPS of \$0.59 against \$0.22 on revenue of \$480.5m. Chime agreed to acquire Stride Bank for \$590m cash and raised Q3 revenue guidance to \$705m from \$680-690m.

10 Macro data

- **The US calendar was effectively empty, and that is part of the story.** Kiplinger's calendar states plainly that there were no noteworthy economic reports scheduled for Wednesday 9 September. Both the wholesale inventories report and the EIA petroleum status report were pushed to Thursday by the Labor Day holiday. Wednesday's move was made by oil and by Treasury, not by data.
- **MBA mortgage applications, week ended 4 September: -2.7%**, against +0.8% the prior week. Refinancings -6.0%. The 30-year fixed contract rate rose 6bp to **6.85%**, the highest since June 2025; ARM share 8.5%. There is no surveyed consensus for this release.
- **10-year Treasury auction, 13:00 ET: high yield 4.834%** against 4.683% at the previous auction. **Bid-to-cover 2.71x**, up from 2.53x. Indirect bidders 79.2%; primary dealers took just 4.3%. **The tail or stop-through could not be verified** — the TreasuryDirect results PDF returned empty and the when-issued level was not obtainable, so no stop-through is claimed here despite secondary reporting of one. The auction size of \$39bn is also unconfirmed against Treasury's own announcement.
- **August CPI, Friday 20:30 HKT, is the week's number.** Consensus per Kiplinger: headline **+0.4% m/m and +3.4% y/y**; core **+2.4% y/y**. Kiplinger also prints core at +0.4% m/m, which is internally inconsistent with a 2.4% core y/y and with the house estimates in its own article — Wells Fargo at +0.23% core m/m and Glenmede at +0.22%. **Treat the core monthly consensus as approximately +0.2%, not +0.4%.**
- **The Cleveland Fed nowcast, updated 8 September, is below the Street on headline:** August CPI +0.36% m/m and **+3.38% y/y**; core +0.20% m/m and +2.38% y/y. For reference, July printed +0.1% m/m / +3.4% y/y headline and +0.2% / +2.5% core. Hedgeye has been arguing materially above both, at 3.7-3.8% and toward 4%.
- **The Fed is priced to hike, not to cut.** CME FedWatch showed roughly a **62% probability of a 25bp increase** to 3.75-4.00% at the 15-16 September meeting as of 9 September, against 44% a month earlier; hold at 38-43%; a cut is effectively not priced. Chair **Kevin Warsh**, in office since 22 May 2026, said at Jackson Hole on 28 August that underlying inflation had not "meaningfully improved" and the Fed has "work to do". Blackout runs 5-17 September.
- **The EIA cut its 2026 world oil demand forecast to 102.6m barrels per day from 102.7m** in the Short-Term Energy Outlook released Wednesday, leaving 2027 unchanged at 105m. The market ignored it entirely, which tells you the bid is supply-driven and not demand-driven.

11 Geopolitics

- **▲ The Strait of Hormuz is now the oil market's dominant variable.** US forces destroyed five vessels linked to the Islamic Revolutionary Guard Corps, including Iranian tankers, after Iran fired ballistic missiles at a US Navy warship; strikes were reported near Kharg Island and the port of Jask. Iran launched at least 20 missiles at bases in Jordan, which says it intercepted 18 with no casualties. UKMTO reported merchant vessels taking disabling fire in the northern Arabian Gulf and the Gulf of Oman. Reporting indicates most shipping through the Strait — which carried roughly a fifth of world oil supply — has halted. Sourced to Reuters, AP, Al Jazeera and Newsquawk; individual claims are attributed to the party making them and several remain contested.
- **▲ The threat has widened beyond Iranian supply to the alternatives.** Iran-aligned Houthi forces attacked energy infrastructure in southern Saudi Arabia including the 400,000 barrel-per-day Jazan refinery; NPR reported fires at Saudi oil facilities and 73 people wounded, with operations temporarily suspended. There are reports Pakistan is weighing strikes on Houthi targets in Yemen under the so-called Makkah Pact with Saudi Arabia and Turkey. That is the escalation path that matters for price: the routes that were absorbing the Hormuz disruption are themselves now targets.
- **◆ President Trump spoke after the crude settle** and said the war would end after the election, that he is not looking for a deal with Iran, that oil will fall afterwards, and that he aims to get gasoline below \$2. The market did not react. AP's own headline framing was that prices are unlikely to come down until after the midterms.
- **◆ Washington is now an explicit participant in the currency market**, which is unusual enough to be a market variable in itself. Bloomberg reported Treasury Secretary Scott Bessent challenging traders to bet against his support for the yen, under the headline framing "I am the house now", and saying he has "pretty good insight" into yen moves. This follows confirmed US participation in coordinated intervention with Japan in early August, when Bessent said Treasury "will not hesitate to participate in further joint intervention". The Senate Banking Committee has written to him about it. **The exact wording and precise date of the latest remark are Bloomberg's characterisation and could not be independently confirmed behind the paywall.**
- **▼ Russia-Ukraine produced no diplomatic progress and one market-relevant strike.** Russian attacks killed at least 12 and injured 72 across Ukraine on 9 September. Ukrainian drones struck a naval base and oil terminal at **Novorossiysk** overnight — a second supply-side pressure point on crude alongside Hormuz. US envoys Witkoff and Kushner met both Putin and Zelenskyy without a breakthrough.

12 Overnight setup — what Asia opens into

INSTRUMENT	06:16 HKT	VS SETTLE	NOTE
ES (E-mini S&P)	7,646.50	▲ +0.04%	1,429 lots. Sixteen minutes of trade — noise, not a signal.
NQ (E-mini Nasdaq)	29,433.00	▼ -0.05%	1,436 lots.
YM (E-mini Dow)	52,469	▲ +0.08%	162 lots — the thinnest of the four.
RTY (E-mini Russell)	2,922.10	▼ -0.03%	594 lots.
USD/JPY	153.495	◆ -0.04%	Range 153.482–153.579. Bank of Japan meets 17–18 September with ~75% odds of a hike priced.
USD/KRW	1,340.01	◆ -0.07%	Won firmer. KOSPI closed +1.40% at 7,051.65 — previous close , Korea is shut.
USD/TWD	31.4559	◆ -0.12%	Taiwan dollar firm into a semiconductor-led open.
USD/CNH	6.70528	◆ -0.02%	Within 0.04% of its 52-week strong point of 6.70286. The most stretched FX row on the board.
EUR/USD	1.16364	◆ +0.02%	ECB decides at 20:15 HKT today; +25bp is fully priced.
Gold (spot)	\$4,402.65	◆ +0.07%	Holding above the 4,381 line. Dec futures 4,449.0, -0.26% overnight.
Silver (spot)	\$67.2646	◆ -0.02%	Futures giving back: SI1! 67.97, -0.99%.
Copper (spot)	\$6.73155	◆ +0.05%	Futures 6.8625, -0.38%, off the 6.894 52-week high.
WTI crude	\$97.57	▲ +1.58%	The row that matters. Above Hedgeye's \$97.53 ceiling, high of \$97.79. 2,266 lots in sixteen minutes.
Brent crude	\$102.46	▲ +1.24%	High \$102.57. Extending the six-session advance.
Bitcoin	\$77,854	▼ -0.75%	New session low \$77,773.62 minutes before capture.
Ether	\$2,446.72	▼ -1.53%	New session low \$2,444.43. 48.5% below its 52-week high.

Previous Asian closes, for reference and marked as such: Nikkei 225 **65,142.71 (-0.19%)**; Hang Seng **25,274.97 (-0.17%)**; KOSPI **7,051.65 (+1.40%)**; Shanghai Composite **3,951.51 (+0.28%)**; ASX 200 **8,911.40 (-0.11%)**; Sensex **74,764.23 (-1.08%)**. European closes on 9 September: DAX -1.66%, CAC 40 -1.94%, Euro Stoxx 50 -1.58%, FTSE 100 -1.31%, IBEX -1.51%.

- **The US hands Asia an energy bid and nothing else.** Energy was the only positive S&P sector and it is extending overnight. Every other sector is negative and the futures have not moved. For Asian energy names and the oil-levered parts of the ASX this is a clean positive; for everything else the handover is a slightly worse cost of capital than yesterday.
- **Korea is the market with something to reprice, and it now has permission from two directions.** The KOSPI closed +1.40% at 7,051.65 having cleared what McCullough called the 6,978 trade line, and Hedgeye covered its South Korea short and its DRAM short on Wednesday. The SOX rose 0.37% and Micron gained 2.75% overnight for Seoul. Against that, McCullough was explicit that the KOSPI trend line at 7,283 has not been reclaimed and that he will not buy a bullish-trade / bearish-trend setup.
- **Japan opens into a stronger yen and a weaker Nikkei than the region.** USD/JPY at 153.495 with the Bank of Japan a week away and the US Treasury openly supporting the currency. Hedgeye remains bearish Japan; a firmer yen is a direct headwind to Tokyo exporters.
- **India is the regional weak spot.** The Sensex fell 1.08% on Wednesday, the worst major Asian close, and a \$100 Brent is a direct terms-of-trade shock for an economy importing more than 85% of its crude.
- **The single instrument most likely to move is crude,** and by extension anything priced off it. It has broken through the risk-range ceiling of the firm most focused on the level, the escalation is live rather than resolved, and the first US inventory number in a fortnight lands at 00:00 HKT tonight.

13 AI watch

- **Meta's Muse is the first mass-market attempt to charge consumers directly for an AI agent** at \$20 and \$100 a month. Whether it works is the question the whole capex cycle has been deferring. Reuters has reported internal concern about the handling of sensitive data, and the launch comes less than two weeks after Meta's \$18bn multistate settlement over social-media harms.
- **Google committed roughly €13bn to Finnish AI infrastructure for 2027–28,** its largest single European investment, across four data-centre locations including Hamina. The genuinely notable part is a **22-year power**

purchase agreement with Fortum for up to half the output of the Loviisa nuclear plant from 2030 to 2049 — compute companies are now signing two-decade nuclear offtake.

- **Qualcomm and Amazon announced a multi-generation custom silicon deal** for AWS AI infrastructure, covering large-scale inference processors and advanced optical interconnect. That opens a second competitive front against Nvidia specifically in inference, where the volume ultimately is.
- **OpenAI claims an internal system more capable than GPT-6 Astra produced a solution to the Navier-Stokes Millennium Prize Problem**, using roughly 10,000 coordinating agents over 88 hours with a Lean-formalised proof. **This is contested.** NYU's Tristan Buckmaster, who was pursuing related work, has questioned whether OpenAI accelerated after learning of his progress; OpenAI denies improper access; independent verification is pending. Reported as a claim, not a result.
- **Commerce and BIS are drafting a rule to block Chinese AI firms renting Nvidia GPU time through South-East Asian data centres**, closing the remote-access loophole left by the 31 May 2026 guidance. Separately, JD Cloud plans a 100,000-GPU cluster on domestic Moore Threads silicon — which would be the first deployment at that scale on Chinese GPUs.
- **Private AI valuations are still rising steeply.** Cognition raised over \$2bn at **\$48bn**, up from \$26bn in May, with ARR reportedly going from \$492m to about \$900m. Harvey raised \$550m at **\$15.6bn** on ARR above \$400m — roughly 39 times revenue — up from \$11bn in March.
- **One item for risk desks rather than technology desks.** Palo Alto's Unit 42 documented an attacker using multiple coordinated AI agents to complete a full enterprise network intrusion in **under ten hours**, deploying more than 50 MITRE ATT&CK techniques — work Unit 42 estimates previously took around two weeks by hand.

14 Beyond the markets

- **Google DeepMind published AlphaGenome Atlas**, AI-generated predictions of the molecular consequences of roughly **nine billion** possible single-letter changes in the human genome — described as the most comprehensive such catalogue assembled, and free to academic researchers. The practical effect is that a search space previously too large to enumerate becomes something a laboratory can query before committing budget.
- **IBM, RIKEN and the Cleveland Clinic simulated a 12,635-atom protein** on a hybrid quantum-classical framework, the largest molecular system of its kind modelled with quantum computers and a 2026 ACM Gordon Bell Prize finalist. The significance is architectural: it validates splitting the problem — quantum hardware for the quantum-mechanical part, classical supercomputing for the rest — rather than waiting for fault-tolerant machines.
- **Fusion developer Helion Energy passed 800 employees** and opened a downtown Seattle office, having raised \$465m this year and more than \$1.5bn in total, with a Malaga, Washington site intended as one of the first commercial fusion plants. The demand pulling it forward is data-centre electricity — the same force behind Google's 22-year nuclear contract above.
- A large real-world study published 9 September reported **semaglutide associated with roughly 40% fewer asthma attacks and 20% fewer COPD flare-ups**. Flagged with a caveat: the primary journal could not be identified from the secondary coverage, so the finding is reported as unverified.

15 Appendix — stock cards

META · META PLATFORMS

653.69 ▲ +6.55%

Cap \$1.67tn · 52w 520.26–790.80 · vol 35.4m vs 19.8m avg · next: Q3 late Oct

Muse launched with paid tiers at \$20 and \$100 — the first direct consumer monetisation of Meta's AI spend. Closed at 78% of range but gave back 0.55% after hours. Hedgeye rates it bullish TRADE only, and McCullough was explicit that the move owes as much to index flow turning on as to the product.

GOOGL · ALPHABET

330.65 ▼ −2.28%

Cap \$4.03tn · 52w 235.84–408.61 · vol 33.0m vs 24.8m avg · next: Q3 late Oct

Worst Mag7 performer, and the direct short leg of the Muse trade — Morgan Stanley called it a new threat to search, Mizuho flagged renewed Gemini concerns. Compounded by EU-mandated search changes. Offset by a €13bn Finnish AI commitment including a 22-year nuclear PPA. Bullish TRADE only on Hedgeye's signal.

ORCL · ORACLE

161.63 ▼ −0.55%

Cap \$466bn · 52w 114.50–331.00 · **51.2% below its 52-week high** · next: fiscal Q1 after the close TODAY, call 05:00 HKT Friday

Consensus roughly \$19.13bn revenue, +28% y/y, and \$1.74 non-GAAP EPS. Guidance is for total cloud +57–63% in constant currency with about \$9bn of fresh IaaS ARR activating. RPO closed fiscal Q4 at a record \$638bn, +363% y/y — **there is no surveyed Street RPO estimate**, only that base. Options price an ~11% move.

UNH · UNITEDHEALTH

393.06 ▼ −1.94%

Cap \$353bn · 52w 255.97–461.62 · **7.5% intraday range** · vol 7.7m vs 4.8m avg

Gapped to \$378.08 on the undisclosed-terms WellMed stake sale to TPG, then recovered to close at 53% of range after management reaffirmed FY26 EPS of \$19.50–\$20.00 and \$24bn operating cash flow. Optum Health margin guided to 2% this year, 4% next. XLV fell only 0.33% — this did not travel.

AMD · ADVANCED MICRO DEVICES

521.10 ▲ +3.04%

Cap \$851bn · 52w 149.85–584.73 · vol 22.1m vs 17.2m avg

CFO Jean Hu put the AI chip TAM at \$2–3tn by 2030 and said data centre more than doubles next year, with wafers, advanced packaging and HBM all tight. Hedgeye removed its short on the AMD Option Income Strategy ETF on Wednesday, which is a covering signal rather than a long.

MU · MICRON

1,027.77 ▲ +2.75%

Cap \$1.16tn · 52w 147.61–1,255.00 · vol 23.7m vs 25.2m avg · next: fiscal Q4, 30 Sep

Goldman turned constructive on memory, arguing the worst of the downturn has passed with positioning still light. The bear counterweight arrived the same day: Kioxia's chief executive said publicly he has told sales teams to stop pushing for higher NAND prices. Hedgeye covered its DRAM short.

AAPL · APPLE

315.34 ▼ −0.28%

Cap \$4.60tn · 52w 226.65–344.57 · vol 65.2m vs 41.1m avg · +0.62% after hours

Sold off through its own launch event — foldable iPhone Duo at \$1,999 from 23 October, iPhone 18 Pro, A20 Pro, AirPods 5. A 9.3-point range on 59% above-average volume around a scheduled event is normal event digestion, not a verdict. Hedgeye keeps it bullish trade and trend "if it holds".

NVDA · NVIDIA

223.67 ▼ −0.91%

Cap \$5.39tn · 52w 164.27–236.54 · vol 79.3m vs 153.8m avg

Fell while the SOX rose — the semiconductor bid was in memory, not accelerators. Volume was barely half its ten-day average, so this was absence of buyers rather than presence of sellers. Named on the Macro Show as one of three megacaps to buy on weakness. Watch the BIS rule on South-East Asian GPU rentals.

16 About this edition

- **Covers** the US cash session of Wednesday 9 September as settled, the after-hours tape to 18:00 ET, the Globex reopen to 06:16 HKT, and the full Hedgeye publication set to 10 September 00:00 HKT.
- **Captured** 06:07:05–06:07:07 HKT, a 2.3-second window, via the standard concurrent capture script; a second targeted pull at 06:16 HKT covers the Globex reopen and is labelled wherever used. TradingView returned 96 of 96 instruments. **Yahoo returned 0 of 62 and aborted on its 429 circuit breaker**, so the machine capture is single-sourced; cross-validation was recovered by hand from wire copy and is documented in section 18.
- **Settled versus live.** Cash equities, sector ETFs and single stocks are settled closes, roughly two hours old. Index and commodity futures are 17:00 ET settles with the live 06:16 HKT print shown separately. Treasury yields are cash marks at 06:07. FX and spot metals rolled their daily bars at 05:00 HKT, so those *changes* cover roughly 67–76 minutes and are marked amber; the levels are live. Crypto is the only continuously traded row.
- **Hedgeye edition: FULL.** The live risk-range set is the Early Look of 9 September, published 07:42 ET / 19:42 HKT, by Keith McCullough — superseded tonight at approximately 19:30 HKT. Also read: The Macro Show summary notes (9 Sep, 22:49 HKT), ETF Pro Plus update (22:28 HKT), Signal Strength Stocks (10 Sep, 00:00 HKT), Macro Week Summary Notes (still dated 4 Sep).

- **Quad path: UNKNOWN and not asserted.** No forward path notation was seen. The US monthly Quad 2 reading is confirmed in writing for the first time in Wednesday's Early Look; the quarterly Quad 4 and global Quad 3 are carried forward from 4 September and are six days old.
- **Not available:** the Hedgeye Monthly Inflation Nowcast (explicit access-denied, subscription tier); the US Monthly Quad Forecast page inside the Macro Week Summary Notes (gated PDF, fourth consecutive edition); IGV and OIH prices (absent from the capture universe, fifth consecutive edition); the 10-year auction tail; the 14-18 September US earnings slate.

18 Data-confidence

CROSS-CHECKS PASSED

- **All four US cash index closes reconcile exactly against an independent wire.** The Associated Press "How major US stock indexes fared" gives S&P 500 -37.16 to 7,636.36; Dow -405.41 to 52,380.66; Nasdaq -168.07 to 26,253.34; Russell 2000 -38.97 to 2,921.23. Every figure matches the TradingView capture to the decimal. This is genuine two-source validation on the most important rows in the brief and it was recovered by hand after the machine cross-check failed.
- **Cash index arithmetic is internally self-consistent.** Close less change equals implied prior close, and change divided by prior close reproduces the stated percentage for all five indices: $SPX\ 7,636.36 - (-37.16) = 7,673.52$, and $-37.16 / 7,673.52 = -0.4843\%$. $Nasdaq\ -168.07 / 26,421.41 = -0.6361\%$. $Dow\ -405.41 / 52,786.07 = -0.7680\%$. $Russell\ -38.97 / 2,960.20 = -1.3164\%$. $SOX\ +43.44 / 11,887.87 = +0.3654\%$.
- **Both crude settles reconcile exactly against Newsquawk's settle wrap:** "WTI (V6) settled USD 3.02 higher at 96.05/bbl; Brent (X6) settled USD 3.29 higher at 101.21/bbl." Identical to the capture on both level and change. Investrade independently confirms WTI +3.02, +3.25%.
- **Futures-to-cash basis is normal across all three comparable pairs,** confirming the futures rows are genuine settles and not mislabelled: ES to SPX +7.39 (+0.097%); YM to DJI +44.34 (+0.085%); RTY to RUT +1.77 (+0.060%). A dislocated basis here would have exposed a stale or wrongly attributed row; none is dislocated.
- **Three of eleven SPDR sectors match Newsquawk's independent sector table to two decimal places** — Industrials -1.51%, Utilities -1.17%, Real Estate -1.12%.
- **Reconciliation counts from the capture script: 0 matched within 5bp, 0 minor, 0 divergent, 57 single-sourced.** There are **no divergent rows to resolve because no second machine source ran** — Yahoo returned nothing. That is not a clean reconciliation and is not presented as one; the wire cross-checks above are what recovers validation on the rows that matter.

KNOWN CONFLICTS AND WEAK MARKS

- **Treasury yields: two sources, two numbers, both printed.** Our capture at 06:07 HKT gives 10-year 4.845% and 2-year 4.436%. Newsquawk's settle marks give 4.833% and 4.425%; Investrade's table gives 4.832%. The gaps are 1.2bp and 1.1bp and are consistent with a 15:00 or 17:00 ET settle mark versus an 18:07 ET print. The brief uses the capture marks because they are contemporaneous with every other row; the settle figures are given here so the reader can choose. **The conclusion — the belly at multi-year highs — is robust on either set; the second decimal is not.**
- **The 52-week-high claim on the 10-year is well supported; the one on the 2-year is inference.** CNN reported bond yields at their highest in almost three years and Investrade explicitly noted the 10-year above 4.85% for the first time since November 2023. For the 2-year, no source explicitly called 9 September a fresh 52-week high — the claim rests on a single TradingView field, where the close of 4.436% equals the recorded 52-week high of 4.436%. Directionally certain, precisely single-sourced.
- **RBOB gasoline fell 1.29% on a day crude rose 3.25%.** That spread is not economically sensible over a single session and is most likely a contract-roll artefact in the continuous series. It is printed as captured and flagged rather than quietly dropped, and no inference is drawn from it.
- **FX and spot-metal change figures cover roughly 67 to 76 minutes, not a session.** The daily bars rolled at 17:00 ET / 05:00 HKT. Spot gold's entire recorded range is 4,402.65-4,406.48, a 0.09% span, which is what a fresh bar looks like. Every such row is

marked amber and described as immaterial. **The levels are live and correct; the changes are noise and are not treated as moves anywhere in this brief.**

- **Index futures rolled sessions between the two pulls, which is why both are shown.** At 06:07 the futures bars still carried the completed 17:00 ET session on full-session volume; by 06:15 they had rolled and were showing 1,200–1,400 lots of new trade. Presenting the 06:07 figure alone as "live" would have been wrong, and presenting the 06:16 figure alone would have discarded the settle. Both are labelled.
- **Meta's relative volume varies by lookback and the sector-level figures differ by construction.** Our 35.4m against a 19.8m ten-day average is close to TradingKey's 35.2m against a 17.8m three-month average; Motley Fool's 17.8m three-month figure is the same denominator. All agree on roughly twice normal. Separately, Newsquawk's Energy +1.09% against XLE's +0.83% and Tech -0.16% against XLK's 0.00% reflect GICS index versus SPDR ETF construction, not a data error; both are printed in section 7.
- **Market capitalisations, the Mag7 aggregate and the Meta/Alphabet value-transfer figures are single-sourced** to one TradingView field and computed from it. The roughly \$102bn created and \$95bn destroyed are arithmetic on that field, not independently reported numbers, and should be read as approximate.
- **Tapestry's 3.29% decline is printed without a cause.** No company-specific catalyst could be found; the HSBC luxury downgrade of LVMH and Burberry is offered explicitly as inference. The price is verified; the explanation is not.

KNOWN GAPS

- **The forward Quad path is unknown, and absence of a printed path is not evidence the path is unchanged.** The notation sits in the US Monthly Quad Forecast inside the Macro Week Summary Notes, still dated 4 September and reachable only through a gated PDF link. This is the fourth consecutive edition unable to read it. No path is asserted anywhere in this brief.
- **The Hedgeye Monthly Inflation Nowcast, published 9 September 00:20 HKT, returned an explicit access-denied page** listing the subscriptions the account does hold. This is a tier boundary, not a fault. It is the publication that would have carried Hedgeye's own August CPI estimate, which matters because the firm has been running 30–40bp above the Cleveland Fed nowcast.
- **IGV and OIH remain absent from the capture universe for a fifth consecutive edition,** so two published risk-range rows carry no position measurement despite Hedgeye publishing bands for both daily and holding OIH long.
- **Absence of a Hedgeye position change is not evidence there was none.** The MOMO Tracker, Crypto Quant, KM's Top 3 and Capital Allocation Pro model-portfolio updates did not appear in the feed window read this morning, and several of these are routinely published as images whose text cannot be extracted. Any of them could have carried a position change that this brief does not report.
- **The 10-year auction tail could not be determined.** The TreasuryDirect results PDF returned empty and no when-issued level was obtainable, so despite secondary reporting of a stop-through, none is claimed. The auction size of \$39bn is likewise unconfirmed against Treasury's own announcement. Bid-to-cover, high yield and the bidder split are confirmed.
- **Other gaps:** no published Street consensus for Oracle's fiscal Q1 RPO exists — only the \$638bn prior-quarter base; the US earnings calendar for 14–18 September could not be confirmed for 2026 and no names are listed; the exact wording and date of the Bessent "I am the house now" remark are Bloomberg's headline framing behind a paywall; the SOX close of 11,931.31 is single-sourced, though the direction is corroborated by several outlets; and the semaglutide study's primary journal was not identified. Asian and European cash markets are shut, so every regional index in this brief is a marked previous close.

TIMING & UNVERIFIED

- **Capture window 06:07:05–06:07:07 HKT (2.3 seconds), with a labelled second pull at 06:16:12 HKT.** The run fired on schedule at 06:06 HKT; there is no off-schedule offset to account for this morning.
- **Age of the stalest rows.** US cash equities, sector ETFs and single-stock prices are approximately **2.1 hours** old at capture. European closes are approximately **8.6 hours** old. Asian closes are between **12 and 17 hours** old. The Hedgeye risk ranges were published **10.4 hours** before capture. The Quad dashboard carried forward from 4 September is **six days** old.
- **What has already moved since the numbers in section 1.** WTI is 1.58% higher than its settle and Brent 1.24% higher; Bitcoin and Ether have both made fresh session lows; December gold, silver and copper futures have each given back between 0.26% and 0.99%. The equity futures have not moved meaningfully.
- **What will be superseded today.** Tonight's Early Look, at approximately 19:30 HKT, replaces every risk range in section 4. The ECB decides at 20:15, US PPI and jobless claims land at 20:30, the delayed EIA petroleum report at 00:00 HKT, and Oracle reports at roughly 04:05 HKT Friday.
- **Verify live prices before acting on anything in this document.** Every level here is a snapshot taken while the largest single market in the brief — crude oil — was actively moving, and it has moved again since.
